

**General information**

Except as otherwise noted near each table and summarized in the last two spreadsheets ("CFMIP output" and "other output"), each output field should be saved for the entire duration of each and every run.

The specifications for archiving model output, as described in the following tables, assume the following (please advise us if the assumptions are incorrect):

1. Sea ice fields and ocean biogeochemistry fields will be archived on the same grid as ocean fields.
2. Land fields (including ice and snow on land) and land biogeochemistry fields will be archived on the same grid as the atmosphere.

The following rules and recommendations for how to calculate quantities should be followed unless a different method is explicitly indicated in the notes that appear in the following tables.

1. It is recommended that ocean and sea-ice output (including Oclim, Oyr, Omon, and Olmon) be reported on the ocean's native grid. Unless noted otherwise in the tables, all other output should be reported on the atmospheric grid.
2. Unless otherwise specified, the ocean and sea-ice output (including Oclim, Oyr, Omon, and Olmon) represents a mean over only the sea portion of each grid cell (i.e., it is interpreted as "where ocean over ocean"), and a value of 0.0 should be reported where the sea fraction is 0.
3. Unless otherwise specified, the land output (in the Lmon and LLimon tables) represents a mean over only the land portion of each grid cell (i.e., it is interpreted as "where land over land"), and a value of 0.0 should be reported where the land fraction is 0.
4. The default interpretation of a Olmon field is that the quantity is averaged over the entire ocean portion of each grid-cell (with a value of zero applying anywhere the quantity is absent in this portion of the cell) and then averaged in time.
4. The default interpretation of a LLimon field is that the quantity is averaged over the entire land portion of each grid-cell (with a value of zero applying anywhere the quantity is absent in this portion of the cell) and then averaged in time.

**A note on priorities.**

The priorities noted in the tables have been largely set by scientists who have participated in model intercomparison activities and have needed these variables in their own research. Since the priorities in different tables were set by different groups of scientists, the priorities in one table may have a different meaning from the priorities in another table. We hope that the vast majority of fields listed in all the tables will be archived by all the modeling groups, but in many cases where a group has not saved a particular field in the past, this may require non-trivial effort. The priorities listed here, along with the participating group's expert judgement should be considered when deciding which fields to save. Please make every effort to save as many of the fields as possible. For lower priority variables, if you can't save them for all the experiments and realizations, please consider saving them for a subset that you think might be of most interest.

## CMOR Table fx: Time-Invariant Fields

fx

fx

on atmospheric grid

Atmospheric and land fields may be submitted on a (single) grid of the modeling group's choosing. We expect most groups will elect to save output on the native grid. If data is "interpolated" to a different grid, it is important to preserve certain global mean properties (e.g., the total surface fluxes of heat, momentum, and water mass).

<i>priority</i>	<b>long name</b>	<b>units</b>	<b>comment</b>	<b>questions &amp; notes</b>	<b>output variable name</b>	<b>standard name</b>
1	Atmosphere Grid-Cell Area	m <sup>2</sup>		For atmospheres with more than 1 mesh (e.g., staggered grids), report areas that apply to surface vertical fluxes of energy.	areacella	cell_area
1	Surface Altitude	m	height above the geoid; as defined here, "the geoid" is a surface of constant geopotential that, if the ocean were at rest, would coincide with mean sea level. Under this definition, the geoid changes as the mean volume of the ocean changes (e.g., due to glacial melt, or global warming of the ocean). Reported here is the height above the present-day geoid (0.0 over ocean).		orog	surface_altitude
1	Land Area Fraction	%		For atmospheres with more than 1 mesh (e.g., staggered grids), report areas that apply to surface vertical fluxes of energy.	sftlf	land_area_fraction
1	Fraction of Grid Cell Covered with Glacier	%	fraction of grid cell occupied by "permanent" ice (i.e., glaciers).	For atmospheres with more than 1 mesh (e.g., staggered grids), report areas that apply to surface vertical fluxes of energy.	sftgif	land_ice_area_fraction
1	Capacity of Soil to Store Water	kg m <sup>-2</sup>	reported "where land": divide the total water holding capacity of all the soil in the grid cell by the land area in the grid cell; reported as "missing" where the land fraction is 0.		mrsocf	soil_moisture_content_at_field_capacity
1	Maximum Root Depth	m	report the maximum soil depth reachable by plant roots (if defined in model), i.e., the maximum soil depth from which they can extract moisture; report as "missing" where the land fraction is 0.		rootd	root_depth

m			real	longitude latitude	rootd	land		area: areacella		

### on ocean grid

The WGOMD has recommended that all ocean fields be saved on the model's native ocean grid. Many groups will also elect to save the sea ice fields on the ocean grid. (The alternative is to save sea ice fields on the atmosphere grid.) If data is "interpolated" from its native grid, it is important to preserve certain global mean properties (e.g., the total surface fluxes of heat, momentum, and water mass into the ocean).

priority	long name	units	comment	questions & notes	output variable name	standard name
1	Sea Floor Depth	m	Ocean bathymetry. Reported here is the sea floor depth for present day. Reported as missing for land grid cells.		deptho	sea_floor_depth_below_geoid
1	Ocean Grid-Cell Volume	$m^3$	grid-cell volume ca. 2000.	a 3-d field: For oceans with more than 1 mesh, report on grid that applies to temperature	volcello	ocean_volume
1	Ocean Grid-Cell Area	$m^2$		For oceans with more than 1 mesh (e.g., staggered grids), report areas that apply to surface vertical fluxes of energy.	areacello	cell_area
1	Sea Area Fraction	%	This is the area fraction at the ocean surface.	Should this be recorded as a function of depth? Report on the same grid that ocean fields are reported (i.e., the ocean native grid, or the grid that ocean data has been provided to CMIP. For completeness, provide this even if the ocean grid is the same as the atmospheric grid.	sftof	sea_area_fraction
1	Region Selection Index	1		Report on the same grid as the temperature field. flag_values=0,1,2,3,4,5,6,7,8,9,10 corresponding to flag_meanings=global_land, southern_ocean, atlantic_ocean, pacific_ocean, arctic_ocean, indian_ocean, mediterranean_sea, black_sea, hudson_bay, baltic_sea, red_sea.	basin	region
2	Upward Geothermal Heat Flux at Sea Floor	$W\ m^{-2}$		If this field is time-dependent then save it instead as one of your Omon fields (see the Omon table)	hfgeou	upward_geothermal_heat_flux_at_sea_floor
2	Ocean Model Cell Thickness	m		If this field is time-dependent then save it instead as one of your Omon fields (see the Omon table)	thkcello	cell_thickness

					name	standard name
1	Dissolved Inorganic Carbon Concentration	mol m <sup>-3</sup>	Dissolved inorganic carbon (CO <sub>3</sub> +HCO <sub>3</sub> +H <sub>2</sub> CO <sub>3</sub> ) concentration		dissic	mole_concentration_of_dissolved_inorganic_carbon_in_sea_water
2	Dissolved Organic Carbon Concentration	mol m <sup>-3</sup>			dissoc	mole_concentration_of_dissolved_organic_carbon_in_sea_water
2	Phytoplankton Carbon Concentration	mol m <sup>-3</sup>	sum of phytoplankton carbon component concentrations. In most (all?) cases this is the sum of phydiat and phymisc (i.e., "Diatom Carbon Concentration" and "Non-Diatom Phytoplankton Carbon Concentration")		phyc	mole_concentration_of_phytoplankton_expressed_as_carbon_in_sea_water
2	Zooplankton Carbon Concentration	mol m <sup>-3</sup>	sum of zooplankton carbon component concentrations		zooc	mole_concentration_of_zooplankton_expressed_as_carbon_in_sea_water
3	Bacterial Carbon Concentration	mol m <sup>-3</sup>	sum of bacterial carbon component concentrations		bacc	mole_concentration_of_bacteria_expressed_as_carbon_in_sea_water
2	Detrital Organic Carbon Concentration	mol m <sup>-3</sup>	sum of detrital organic carbon component concentrations		detoc	mole_concentration_of_organic_detritus_expressed_as_carbon_in_sea_water
2	Calcite Concentration	mol m <sup>-3</sup>	sum of particulate calcite component concentrations (e.g. Phytoplankton, Detrital, etc.)		calc	mole_concentration_of_calcite_expressed_as_carbon_in_sea_water
2	Aragonite Concentration	mol m <sup>-3</sup>	sum of particulate aragonite components (e.g. Phytoplankton, Detrital, etc.)		arag	mole_concentration_of_aragonite_expressed_as_carbon_in_sea_water
3	Mole Concentration of Diatoms expressed as Carbon in Sea Water	mol m <sup>-3</sup>	carbon from the diatom phytoplankton component concentration alone		phydiat	mole_concentration_of_diatoms_expressed_as_carbon_in_sea_water
3	Mole Concentration of Diazotrophs Expressed as Carbon in Sea Water	mol m <sup>-3</sup>	carbon concentration from the diazotrophic phytoplankton component alone		phydiaz	mole_concentration_of_diazotrophs_expressed_as_carbon_in_sea_water
3	Mole Concentration of Calcareous Phytoplankton expressed as Carbon in Sea Water	mol m <sup>-3</sup>	carbon concentration from calcareous (calcite-producing) phytoplankton component alone		phycalc	mole_concentration_of_calcareous_phytoplankton_expressed_as_carbon_in_sea_water
3	Mole Concentration of Picophytoplankton expressed as Carbon in Sea Water	mol m <sup>-3</sup>	carbon concentration from the picophytoplankton (<2 um) component alone		phypico	mole_concentration_of_picophytoplankton_expressed_as_carbon_in_sea_water
3	Mole Concentration of Miscellaneous Phytoplankton expressed as Carbon in Sea Water	mol m <sup>-3</sup>	carbon concentration from additional phytoplankton component alone		phymisc	mole_concentration_of_miscellaneous_phytoplankton_expressed_as_carbon_in_sea_water
3	Mole Concentration of Microzooplankton expressed as Carbon in Sea Water	mol m <sup>-3</sup>	carbon concentration from the microzooplankton (<20 um) component alone		zmicro	mole_concentration_of_microzooplankton_expressed_as_carbon_in_sea_water
3	Mole Concentration of Mesozooplankton expressed as Carbon in Sea Water	mol m <sup>-3</sup>	carbon concentration from mesozooplankton (20-200 um) component alone		zmeso	mole_concentration_of_mesozooplankton_expressed_as_carbon_in_sea_water
3	Other Zooplankton Carbon Concentration	mol m <sup>-3</sup>	carbon from additional zooplankton component concentrations alone (e.g. Micro, meso). Since the models all have different numbers of components, this variable has been included to provide a check for intercomparison between models since some phytoplankton groups are supersets.		zoocmisc	mole_concentration_of_miscellaneous_zooplankton_expressed_as_carbon_in_sea_water
1	Total Alkalinity	mol m <sup>-3</sup>	total alkalinity equivalent concentration (including carbonate, nitrogen, silicate, and borate components)		talk	sea_water_alkalinity_expressed_as_mole_equivalent
1	pH	1	negative log of hydrogen ion concentration with the concentration expressed as mol H kg <sup>-1</sup> .		ph	sea_water_ph_reported_on_total_scale
1	Dissolved Oxygen Concentration	mol m <sup>-3</sup>			o2	mole_concentration_of_molecular_oxygen_in_sea_water
1	Dissolved Nitrate Concentration	mol m <sup>-3</sup>			no3	mole_concentration_of_nitrate_in_sea_water

**In CMOR Table Amon: Atmospheric 3-D fields on standard pressure levels, except 4 cloud fields which are on model levels.**

Include the following mandatory pressure levels (which are available from all available reanalyses and CMIP3): 1000, 925, 850, 700, 600, 500, 400, 300, 250, 200, 150, 100, 70, 50, 30, 20, and 10 hPa; Also include, when appropriate, output on the following additional pressure levels: 7, 5, 3, 2, 1 and 0.4 hPa.

priority	long name	units	comment	questions & notes	output variable	
					name	standard name
1	Cloud Area Fraction	%	Includes both large-scale and convective cloud. Includes both large-scale and convective cloud.	Report on model layers (not standard pressures).	cl	cloud_area_fraction_in_atmosphere_layer
1	Mass Fraction of Cloud Liquid Water	1	Calculate as the mass of cloud liquid water in the grid cell divided by the mass of air (including the water in all phases) in the grid cells. Precipitating hydrometeors are included ONLY if the precipitating hydrometeors affect the calculation of radiative transfer in model.	Report on model layers (not standard pressures).	clw	mass_fraction_of_cloud_liquid_water_in_air
1	Mass Fraction of Cloud Ice	1	Includes both large-scale and convective cloud. This is calculated as the mass of cloud ice in the grid cell divided by the mass of air (including the water in all phases) in the grid cell. It includes precipitating hydrometeors ONLY if the precipitating hydrometeors affect the calculation of radiative transfer in model.	Report on model layers (not standard pressures).	cli	mass_fraction_of_cloud_ice_in_air
1	Convective Mass Flux	kg m <sup>-2</sup> s <sup>-1</sup>	The net mass flux should represent the difference between the updraft and downdraft components. The flux is computed as the mass divided by the area of the grid cell.	Report on model half-levels (i.e., model layer bounds and not standard pressures).	mc	atmosphere_net_upward_convective_mass_flux

1 Mole Fraction of CO2

1e-6

For some simulations (e.g., prescribed concentration pi-control run), this will not vary from one year to the next, and so report instead the variable described in the next table entry. If spatially uniform, omit this field, but report Total Atmospheric Mass of CO2 (see the table entry after the next one). **Are these the preferred units or should it be a unitless fraction? Should this field be reported instead on model levels? Or should we also require either the vertically integrated mole fraction (or mass?) of this species or the vertically integrated globally averaged mole fraction (or mass?)?**

co2

mole\_fraction\_of\_carbon\_dioxide\_in\_air

1 Mole Fraction of CO2

1e-6

Report only for simulations (e.g., prescribed concentration pi-control run), in which the CO2 does not vary from one year to the next. Report 12 monthly values, starting with January, even if the values don't vary seasonally. When calling CMOR, identify this variable as co2Clim, not co2. If CO2 is spatially uniform, omit this field, but report Total Atmospheric Mass of CO2 (see the table entry after the next). **Are these the preferred units or should it be a unitless fraction? Should this field be reported instead on model levels? Or should we also require either the vertically integrated mole fraction (or mass?) of this species or the vertically integrated globally averaged mole fraction (or mass?)?**

co2

mole\_fraction\_of\_carbon\_dioxide\_in\_air

1 Total Atmospheric Mass of CO2

kg

For some simulations (e.g., prescribed concentration pi-control run), this will not vary from one year to the next, and so report instead the variable described in the next table entry. If CO2 is spatially nonuniform, omit this field, but report Mole Fraction of CO2 (see the table entry before the previous one).

co2mass

atmosphere\_mass\_of\_carbon\_dioxide

1 Total Atmospheric Mass of CO2

kg

Report only for simulations (e.g., prescribed concentration pi-control run), in which the CO2 does not vary from one year to the next. Report 12 monthly values, starting with January, even if the values don't vary seasonally. When calling CMOR, identify this variable as co2massClim, not co2mass. If CO2 is spatially nonuniform, omit this field, but report Mole Fraction of CO2 (see the table entry before the previous one).

co2mass

atmosphere\_mass\_of\_carbon\_dioxide

1 Mole Fraction of CH4

1e-9

For some simulations (e.g., prescribed concentration pi-control run), this will not vary from one year to the next, and so report instead the variable described in the next table entry. If CH4 is spatially uniform, omit this field, but report Global Mean Mole Fraction of CH4 (see the table entry after the next one). **Are these the preferred units or should it be a unitless fraction? Should this field be reported instead on model levels? Or should we also require either the vertically integrated mole fraction (or mass?) of this species or the vertically integrated globally averaged mole fraction (or mass?)?**

ch4

mole\_fraction\_of\_methane\_in\_air

1 Mole Fraction of CH4

1e-9

Report only for simulations (e.g., prescribed concentration pi-control run), in which the CH4 does not vary from one year to the next. Report 12 monthly values, starting with January, even if the values don't vary seasonally. When calling CMOR, identify this variable as ch4global, not ch4. If CH4 is spatially uniform, omit this field, but report Global Mean Mole Fraction of CH4 (see the table entry after the next). **Are these the preferred units or should it be a unitless fraction? Should this field be reported instead on model levels? Or should we also require either the vertically integrated mole fraction (or mass?) of this species or the vertically integrated globally averaged mole fraction (or mass?)?**

ch4

mole\_fraction\_of\_methane\_in\_air

1 Global Mean Mole Fraction of CH4

1e-9

For some simulations (e.g., prescribed concentration pi-control run), this will not vary from one year to the next, and so report instead the variable described in the next table entry. If CH4 is spatially nonuniform, omit this field, but report Mole Fraction of CH4 (see the table entry before the previous one). **Are these the preferred units or should it be a unitless fraction? Should this field be reported instead on model levels? Or should we also require either the vertically integrated mole fraction (or mass?) of this species or the vertically integrated globally averaged mole fraction (or mass?)?**

1 Mole Fraction of Other Radiatively  
Important Trace Gases (That Are  
Evolving in Time).

1

Please let me know what (if any) other trace gas concentrations should be included. If assumed spatially uniform, report only time-series of the single value. For some simulations (e.g., prescribed concentration pi-control run), this will not vary from one year to the next, and so report values for only 12 months (starting with January. (Note: include all 12 months even if the values don't vary seasonally.)

#### In CMOR Table Amon: Climatological atmospheric 3-D pressure fields

These field are requested *only for models in which the pressure can't be calculated from the vertical coordinate information stored already for each variable.* Thus, the pressures on each model level are needed for height or theta-coordinate models, for example, but not sigma- or eta-coordinate models. The annual cycle climatology (computed from an appropriate segment of the pre-industrial control run) should be reported on model levels and half levels. DO **NOT** REPORT ALL MONTHS FOR ALL EXPERIMENTS: Report only 12 months of data representing the climatology of the pre-industrial control run.

1	Pressure on Model Levels	Pa			pfull	air_pressure
1	Pressure on Model Half-Levels	Pa			phalf	air_pressure

#### In CMOR Table Amon: 2-D bias-corrected fields on atmospheric grid

These fields are derived from fields in the first table above. They have been "bias-corrected" to remove some of the unrealistic behavior caused by the initialization procedure. See recommendations for how this should be done at [http://www.wcrp-climate.org/decadal/references/DCPP\\_Bias\\_Correction.pdf](http://www.wcrp-climate.org/decadal/references/DCPP_Bias_Correction.pdf) (Also see <http://www.wcrp-climate.org/decadal/>.) **These fields should be reported only for decadal hindcast/forecast experiments.**

**In CMOR Table Omon: WGOMD Table 2.5**

priority	long name	units	comment	questions & notes	output variable	
					name	standard name
2	Rainfall Flux where Ice Free Ocean over Sea	$\text{kg m}^{-2} \text{s}^{-1}$	computed as the total mass of liquid water falling as liquid rain into the ice-free portion of the ocean divided by the area of the ocean portion of the grid cell.		pr	rainfall_flux
2	Snowfall Flux where Ice Free Ocean over Sea	$\text{kg m}^{-2} \text{s}^{-1}$	computed as the total mass per unit time of solid-phase precipitation falling into the ice-free portion of the ocean divided by the area of the ocean portion of the grid cell. (Snowfall flux includes all types of solid-phase precipitation.)		prsn	snowfall_flux
2	Water Evaporation Flux Where Ice Free Ocean over Sea	$\text{kg m}^{-2} \text{s}^{-1}$	computed as the total mass of water vapor evaporating from the ice-free portion of the ocean divided by the area of the ocean portion of the grid cell.		evs	water_evaporation_flux
2	Water Flux into Sea Water From Rivers	$\text{kg m}^{-2} \text{s}^{-1}$	computed as the river flux of water into the ocean divided by the area of the ocean portion of the grid cell.		friver	water_flux_into_sea_water_from_rivers
2	Water Flux into Sea Water From Icebergs	$\text{kg m}^{-2} \text{s}^{-1}$	computed as the iceberg melt water flux into the ocean divided by the area of the ocean portion of the grid cell.		ficeberg	water_flux_into_sea_water_from_icebergs
2	Water Flux into Sea Water From Icebergs	$\text{kg m}^{-2} \text{s}^{-1}$	computed as the iceberg melt water flux into the ocean divided by the area of the ocean portion of the grid cell.	If only the vertically integrated melt water flux is available, report as this 2-d field; otherwise the row above should be used.	ficeberg	water_flux_into_sea_water_from_icebergs
1	Water Flux into Sea Water due to Sea Ice Thermodynamics	$\text{kg m}^{-2} \text{s}^{-1}$	computed as the sea ice thermodynamic water flux into the ocean divided by the area of the ocean portion of the grid cell.	The priority set by the WGOMD was 2 for this field. The sea-ice folks requested that the priority be raised to 1.	fsitherm	water_flux_into_sea_water_due_to_sea_ice_thermodynamic_s
2	Water Flux into Sea Water	$\text{kg m}^{-2} \text{s}^{-1}$	computed as the water flux into the ocean divided by the area of the ocean portion of the grid cell. This is the sum of the next two variables in this table.		wfo	water_flux_into_sea_water
2	Water Flux into Sea Water Without Flux Correction	$\text{kg m}^{-2} \text{s}^{-1}$	computed as the water flux (without flux correction) into the ocean divided by the area of the ocean portion of the grid cell.	This should probably be the sum of the first 6 variables in this table. If this does not vary from one year to the next, report only a single year.	wfonocorr	water_flux_into_sea_water_without_flux_correction
2	Water Flux Correction	$\text{kg m}^{-2} \text{s}^{-1}$	Positive flux implies correction adds water to ocean.		wfcorr	water_flux_correction

2	Virtual Salt Flux into Sea Water due to Rainfall	$\text{kg m}^{-2} \text{s}^{-1}$		vsfpr	virtual_salt_flux_into_sea_water_due_to_rainfall	
2	Virtual Salt Flux into Sea Water due to Evaporation	$\text{kg m}^{-2} \text{s}^{-1}$		vsfevap	virtual_salt_flux_into_sea_water_due_to_evaporation	
2	Virtual Salt Flux into Sea Water From Rivers	$\text{kg m}^{-2} \text{s}^{-1}$		vsfriver	virtual_salt_flux_into_sea_water_from_rivers	
1	Virtual Salt Flux into Sea Water due to Sea Ice Thermodynamics	$\text{kg m}^{-2} \text{s}^{-1}$	This variable measures the virtual salt flux into sea water due to the melting of sea ice. It is set to zero in models which receive a real water flux.	The priority set by the WGOMD was 2 for this field. The sea-ice folks requested that the priority be raised to 1.	vsfsit	virtual_salt_flux_into_sea_water_due_to_sea_ice_thermodynamics
2	Virtual Salt Flux into Sea Water	$\text{kg m}^{-2} \text{s}^{-1}$		If this does not vary from one year to the next, report only a single year. Positive flux implies correction increases salinity of water. This includes all virtual salt flux, including that due to a salt flux correction.	vsf	virtual_salt_flux_into_sea_water
2	Virtual Salt Flux Correction	$\text{kg m}^{-2} \text{s}^{-1}$			vsfcorr	virtual_salt_flux_correction
1	Downward Sea Ice Basal Salt Flux	$\text{kg m}^{-2} \text{s}^{-1}$	This field is physical, and it arises since sea ice has a nonzero salt content, so it exchanges salt with the liquid ocean upon melting and freezing.	The priority set by the WGOMD was 2 for this field. The sea-ice folks requested that the priority be raised to 1.	sfdsi	downward_sea_ice_basal_salt_flux
2	Salt Flux into Sea Water from Rivers	$\text{kg m}^{-2} \text{s}^{-1}$			sfriver	salt_flux_into_sea_water_from_rivers

2	Upward Geothermal Heat Flux at Sea Floor	$\text{W m}^{-2}$		If this field is time-invariant, then save it instead as one of your "fixed" fields (see the fx table)	hfgeou	upward_geothermal_heat_flux_at_sea_floor
2	Temperature Flux due to Rainfall Expressed as Heat Flux into Sea Water	$\text{W m}^{-2}$	This is defined as "where ice_free_sea over sea"; i.e., the total flux (considered here) entering the ice-free portion of the grid cell divided by the area of the ocean portion of the grid cell.		hfrainds	temperature_flux_due_to_rainfall_expressed_as_heat_flux_into_sea_water
2	Temperature Flux due to Evaporation Expressed as Heat Flux Out of Sea Water	$\text{W m}^{-2}$	This is defined as "where ice_free_sea over sea"		hfevapds	temperature_flux_due_to_evaporation_expressed_as_heat_flux_out_of_sea_water
2	Temperature Flux due to Runoff Expressed as Heat Flux into Sea Water	$\text{W m}^{-2}$		In general this should be reported as a function of depth, (i.e., it will be a function of the generic "XYZ" dimensions). Include enough depth levels to represent the non-zero values of this field everywhere on the globe.	hfrunoffs	temperature_flux_due_to_runoff_expressed_as_heat_flux_into_sea_water
2	Temperature Flux due to Runoff Expressed as Heat Flux into Sea Water	$\text{W m}^{-2}$		If only the vertically integrated runoff flux is available, report as this 2-d field; otherwise the row above should be used.	hfrunoffds	temperature_flux_due_to_runoff_expressed_as_heat_flux_into_sea_water
2	Heat Flux into Sea Water due to Snow Thermodynamics	$\text{W m}^{-2}$		In general this should be reported as a function of depth, (i.e., it will be a function of the generic "XYZ" dimensions). Include enough depth levels to represent the non-zero values of this field everywhere on the globe.	hfsnthermds	heat_flux_into_sea_water_due_to_snow_thermodynamics
2	Heat Flux into Sea Water due to Snow Thermodynamics	$\text{W m}^{-2}$		If only the vertically integrated heat flux is available, report as this 2-d field; otherwise the row above should be used.	hfsnthermds	heat_flux_into_sea_water_due_to_snow_thermodynamics
1	Heat Flux into Sea Water due to Frazil Ice Formation	$\text{W m}^{-2}$		As of May 2010, the WGOMD document recommends that this field should be saved instead of the field listed 2-lines below. In general this should be reported as a function of depth, (i.e., it will be a function of the generic "XYZ" dimensions). Include enough depth levels to represent the non-zero values of this field everywhere on the globe.	hfsfrazil	heat_flux_into_sea_water_due_to_freezing_of_frazil_ice
1	Heat Flux into Sea Water due to Frazil Ice Formation	$\text{W m}^{-2}$		If only the vertically integrated heat flux is available, report as this 2-d field; otherwise the row above should be used.	hfsfrazil	heat_flux_into_sea_water_due_to_freezing_of_frazil_ice
1	Heat Flux into Sea Water due to Sea Ice Thermodynamics	$\text{W m}^{-2}$		The priority set by the WGOMD was 2 for this field. The sea-ice folks requested that the priority be raised to 1. As of May 2010, the WGOMD document recommends that instead of saving this field, the field listed 2-lines above should be saved instead. In general this should be reported as a function of depth, (i.e., it will be a function of the generic "XYZ" dimensions). Include enough depth levels to represent the non-zero values of this field everywhere on the globe.	hsfithermds	heat_flux_into_sea_water_due_to_sea_ice_thermodynamics

## CMOR Table LImon: Monthly Mean Land Cryosphere Fields

LImon

mon

(All fields should be saved on the atmospheric grid; unless otherwise indicated, values are averaged over only the land portion of each grid cell and report 0.0 where land fraction is 0.)

priority	long name	units	comment	questions & notes	output variable name	standard name
1	Snow Area Fraction	%	Fraction of each grid cell that is occupied by snow that rests on land portion of cell.		snc	surface_snow_area_fraction
1	Surface Snow Amount	$\text{kg m}^{-2}$	Computed as the mass of surface snow on the land portion of the grid cell divided by the land area in the grid cell; reported as 0.0 where the land fraction is 0; excluded is snow on vegetation canopy or on sea ice.		snw	surface_snow_amount
1	Snow Depth	m	where land over land, this is computed as the mean thickness of snow in the land portion of the grid cell (averaging over the entire land portion, including the snow-free fraction). Reported as 0.0 where the land fraction is 0.		snd	surface_snow_thickness
2	Liquid Water Content of Snow Layer	$\text{kg m}^{-2}$	where land over land: this is computed as the total mass of liquid water contained interstitially within the snow layer of the land portion of a grid cell divided by the area of the land portion of the cell.		lwsnl	liquid_water_content_of_snow_layer
2	Snow Soot Content	$\text{kg m}^{-2}$	the entire land portion of the grid cell is considered, with snow soot content set to 0.0 in regions free of snow.		sootsn	soot_content_of_surface_snow
1	Snow Age	day	When computing the time-mean here, the time samples, weighted by the mass of snow on the land portion of the grid cell, are accumulated and then divided by the sum of the weights. Reported as "missing in regions free of snow on land."		agesno	age_of_surface_snow
1	Snow Internal Temperature	K	This temperature is averaged over all the snow in the grid cell that rests on land or land ice. When computing the time-mean here, the time samples, weighted by the mass of snow on the land portion of the grid cell, are accumulated and then divided by the sum of the weights. Reported as "missing in regions free of snow on land."		tsn	temperature_in_surface_snow
1	Surface Snow Melt	$\text{kg m}^{-2} \text{s}^{-1}$	Computed as the total surface melt water on the land portion of the grid cell divided by the land area in the grid cell; report as 0.0 for snow-free land regions; report as 0.0 where the land fraction is 0.		snm	surface_snow_melt_flux
1	Surface Snow and Ice Sublimation Flux	$\text{kg m}^{-2} \text{s}^{-1}$	The snow and ice sublimation flux is the loss of snow and ice mass resulting from their conversion to water vapor. Computed as the total sublimation on the land portion of the grid cell divided by the land area in the grid cell; reported as 0.0 for snow-free land regions; reported as 0.0 where the land fraction is 0.		sbl	surface_snow_and_ice_sublimation_flux
1	Downward Heat Flux into Snow Where Land over Land	$\text{W m}^{-2}$	the net downward heat flux from the atmosphere into the snow that lies on land divided by the land area in the grid cell; reported as 0.0 for snow-free land regions or where the land fraction is 0.		hfdsn	surface_downward_heat_flux_in_snow
3	Permafrost Layer Thickness	m	where land over land: This is the mean thickness of the permafrost layer in the land portion of the grid cell. Reported as 0.0 in permafrost-free regions.		tpf	permafrost_layer_thickness
3	Liquid Water Content of Permafrost Layer	$\text{kg m}^{-2}$	"where land over land", i.e., this is the total mass of liquid water contained within the permafrost layer within the land portion of a grid cell divided by the area of the land portion of the cell.	Why do you want to know mass of liquid water? Are you studying the seasonal melting/freezing cycle? Don't you care about how much frozen water is tied up as permafrost?	pflw	liquid_water_content_of_permafrost_layer

## CMOR Table Olmon: Monthly Mean Ocean Cryosphere Fields

Olmon

mon

(All saved on the ocean grid; unless otherwise indicated, values are averaged over only the ocean portion of each grid cell and report 0.0 where ocean fraction is 0.)

priority	long name	units	comment	questions & notes	output variable	
					name	standard name
1	Sea Ice Area Fraction	%	fraction of grid cell covered by sea ice.		sic	sea_ice_area_fraction
1	Sea Ice Thickness	m	the mean thickness of sea ice in the ocean portion of the grid cell (averaging over the entire ocean portion, including the ice-free fraction). Reported as 0.0 in regions free of sea ice.		sit	sea_ice_thickness
1	Sea Ice Plus Surface Snow Amount	kg m <sup>-2</sup>	the mass per unit area of sea ice plus snow in the ocean portion of the grid cell (averaging over the entire ocean portion, including the ice-free fraction). Reported as 0.0 in regions free of sea ice.		sim	sea_ice_and_surface_snow_amount
1	Water Evaporation Flux from Sea Ice	kg m <sup>-2</sup> s <sup>-1</sup>	the average rate that water mass evaporates (or sublimates) from the sea ice surface (i.e., kg/s) divided by the area of the ocean (i.e., open ocean + sea ice) portion of the grid cell. This quantity, multiplied both by the ocean area of the grid cell and by the length of the month, should yield the total mass of water evaporated (or sublimated) from the sea ice. Reported as 0.0 in regions free of sea ice. [This was computed differently in CMIP3.]		evap	water_evaporation_flux
1	Snow Depth	m	the mean thickness of snow in the ocean portion of the grid cell (averaging over the entire ocean portion, including the snow-free ocean fraction). Reported as 0.0 in regions free of snow-covered sea ice.		snd	surface_snow_thickness
2	Surface Snow Area Fraction	%	Fraction of entire grid cell covered by snow that lies on sea ice; exclude snow that lies on land or land ice.		snc	surface_snow_area_fraction
1	Sea Ice Albedo	1	Reported as "missing" if there is no sunlight or if a region is free of sea ice.	This variable may be omitted unless the answers to the following questions are obvious: Will this vary from year to year or is it a property of "bare sea ice" and sun angle? How is the time-mean calculated?	ialb	sea_ice_albedo
3	Sea Ice Salinity	psu	When computing the time-mean here, the time-samples, weighted by the mass of sea ice in the grid cell, are accumulated and then divided by the sum of the weights. Reported as "missing" in regions free of sea ice.		ssi	sea_ice_salinity
1	Surface Temperature of Sea Ice	K	When computing the time-mean here, the time-samples, weighted by the area of sea ice in the grid cell, are accumulated and then divided by the sum of the weights. Reported as "missing" in regions free of sea ice. Note this will be the surface snow temperature in regions where snow covers the sea ice.		tsice	surface_temperature
1	Temperature at Interface Between Sea Ice and Snow	K	When computing the time-mean here, the time-samples, weighted by the area of snow-covered sea ice in the grid cell, are accumulated and then divided by the sum of the weights. Reported as "missing" in regions free of snow-covered sea ice.		tsnint	sea_ice_surface_temperature
1	Surface Rainfall Rate into the Sea Ice Portion of the Grid Cell	kg m <sup>-2</sup> s <sup>-1</sup>	where sea ice over sea: this is the the water mass per unit time falling as rain onto the sea ice portion of a grid cell divided by the area of the ocean portion of the grid cell (including both ice-free and sea-ice covered fractions). Reported as 0. in regions free of sea ice.		pr	rainfall_flux

1	Surface Snowfall Rate into the Sea Ice Portion of the Grid Cell	$\text{kg m}^{-2} \text{s}^{-1}$	where sea ice over sea: this is computed as the total mass per unit time of solid-phase precipitation falling onto the sea ice portion of a grid cell divided by the area of the ocean portion of the grid cell (including both ice-free and sea-ice covered fractions). Reported as 0. in regions free of sea ice. (Snowfall flux includes all types of solid-phase precipitation.)	prsn	snowfall_flux
3	Age of Sea Ice	years	When computing the time-mean here, the time samples, weighted by the mass of sea ice in the grid cell, are accumulated and then divided by the sum of the weights. Reported as "missing" in regions free of sea ice.	ageice	age_of_sea_ice
1	Frazil Sea Ice Growth (Leads) Rate	$\text{kg m}^{-2} \text{s}^{-1}$	the rate of change of sea ice mass due to frazil sea ice formation divided by the area of the ocean portion of the grid cell. Reported as 0.0 in regions free of sea ice.	grFrazil	tendency_of_sea_ice_amount_due_to_frazil_ice_accumulation_in_leads
1	Congelation Sea Ice Growth Rate	$\text{kg m}^{-2} \text{s}^{-1}$	the rate of change of sea ice mass due to congelation sea ice divided by the area of the ocean portion of the grid cell. Reported as 0.0 in regions free of sea ice.	grCongel	tendency_of_sea_ice_amount_due_to_congelation_ice_accretion
1	Lateral Sea Ice Growth Rate	$\text{kg m}^{-2} \text{s}^{-1}$	the rate of change of sea ice mass due to lateral growth alone of the sea ice divided by the area of the ocean portion of the grid cell. Reported as 0.0 in regions free of sea ice.	grLateral	tendency_of_sea_ice_amount_due_to_lateral_growth_of_ice_floes
1	Snow-Ice Formation Rate	$\text{kg m}^{-2} \text{s}^{-1}$	the rate of change of sea ice mass due to transformation of snow to sea ice, divided by the area of the ocean portion of the grid cell. Reported as 0.0 in regions free of snow-covered sea ice.	snoToIce	tendency_of_sea_ice_amount_due_to_snow_conversion
1	Snow Melt Rate	$\text{kg m}^{-2} \text{s}^{-1}$	the rate of change of snow mass due to melting, divided by the area of the ocean portion of the grid cell. Reported as 0.0 in regions free of sea ice. Includes falling snow that melts on impact with the surface.	snomelt	surface_snow_melt_flux
1	Rate of Melt at Upper Surface of Sea Ice	$\text{kg m}^{-2} \text{s}^{-1}$	the rate of change of sea ice mass due to melting at its upper surface, divided by the area of the ocean portion of the grid cell. Reported as 0.0 in regions free of sea ice. Does not include rate of change of snow mass.	tmelt	tendency_of_sea_ice_amount_due_to_surface_melting
1	Rate of Melt at Sea Ice Base	$\text{kg m}^{-2} \text{s}^{-1}$	the rate of change of sea ice mass due to melting at its lower surface, divided by the area of the ocean portion of the grid cell. Reported as 0.0 in regions free of sea ice.	bmelt	tendency_of_sea_ice_amount_due_to_basal_melting
2	Sea Ice Heat Content	$\text{J m}^{-2}$	Ice at 0 Celsius is assumed taken to have a heat content of 0 J. When averaging over time, this quantity is weighted by the mass of sea ice. Reported as "missing" in regions free of sea ice. Does not include heat content of snow.	hcice	integral_of_sea_ice_temperature_wrt_depth_expressed_as_heat_content
1	Downwelling Shortwave over Sea Ice	$\text{W m}^{-2}$	the downwelling shortwave flux in regions of sea ice divided by the priority was raised from 2 to 1 because area of the ocean portion of the grid cell.	rdsssi	surface_downwelling_shortwave_flux_in_air
1	Upward Shortwave over Sea Ice	$\text{W m}^{-2}$	the upward shortwave flux in regions of sea ice divided by the area priority was raised from 2 to 1 because of the ocean portion of the grid cell. snow albedo was deleted.	rsussi	surface_upwelling_shortwave_flux_in_air
2	Downwelling Long Wave over Sea Ice	$\text{W m}^{-2}$	the downwelling longwave flux in regions of sea ice divided by the area of the ocean portion of the grid cell.	rldssi	surface_downwelling_longwave_flux_in_air
2	Upward Long Wave over Sea Ice	$\text{W m}^{-2}$	the upward longwave flux in regions of sea ice divided by the area of the ocean portion of the grid cell.	rlussi	surface_upwelling_longwave_flux_in_air
2	Surface Upward Sensible Heat Flux over Sea Ice	$\text{W m}^{-2}$	the upward sensible heat flux in regions of sea ice divided by the area of the ocean portion of the grid cell.	hfssi	surface_upward_sensible_heat_flux
2	Surface Upward Latent Heat Flux over Sea Ice	$\text{W m}^{-2}$	the upward latent heat flux in regions of sea ice divided by the area of the ocean portion of the grid cell.	hfssi	surface_upward_latent_heat_flux
2	Sublimation over Sea Ice	$\text{kg m}^{-2} \text{s}^{-1}$	the upward flux of water vapor to the atmosphere due to sublimation of snow and sea ice in regions of sea ice divided by the area of the ocean portion of the grid cell.	sblsi	surface_snow_and_ice_sublimation_flux
1	X-Component of Sea Ice Mass Transport	$\text{kg s}^{-1}$	The sea ice mass transport is 0.0 in ice-free regions of the ocean. Snow is included in calculation of mass.	transix	sea_ice_x_transport
1	Y-Component of Sea Ice Mass Transport	$\text{kg s}^{-1}$	The sea ice mass transport is 0.0 in ice-free regions of the ocean. Snow is included in calculation of mass.	transiy	sea_ice_y_transport
2	Sea Ice Mass Transport Through Fram Strait	$\text{kg s}^{-1}$		transifs	sea_ice_transport_across_line

(All Saved on the Atmospheric Grid)**

aero

mon

In CMOR Table aero: 2-D fields on atmospheric grid

priority	long name	units	comment	questions & notes	output variable name	standard name
<b>Aerosol Optics</b>						
1	Ambient Aerosol Optical Thickness at 550 nm	1	AOD from the ambient aerosols (i.e., includes aerosol water). Does not include AOD from stratospheric aerosols if these are prescribed but includes other possible background aerosol types.		od550aer	atmosphere_optical_thickness_due_to_ambient_aerosol
1	Ambient Fine Aerosol Optical Thickness at 550 nm	1	od550 due to particles with wet diameter less than 1 um ("ambient" means "wetted"). When models do not include explicit size information, it can be assumed that all anthropogenic aerosols and natural secondary aerosols have diameter less than 1 um.		od550lt1aer	atmosphere_optical_thickness_due_to_pm1_ambient_aerosol
1	Ambient Aerosol Absorption Optical Thickness at 550 nm	1			abs550aer	atmosphere_absorption_optical_thickness_due_to_ambient_aerosol
2	Ambient Aerosol Optical Thickness at 870 nm	1	AOD from the ambient aerosols (i.e., includes aerosol water). Does not include AOD from stratospheric aerosols if these are prescribed but includes other possible background aerosol types.		od870aer	atmosphere_optical_thickness_due_to_ambient_aerosol
<b>Aerosol Budgets</b>						
1	Rate of Emission and Production of Dry Aerosol Total Organic Matter	kg m <sup>-2</sup> s <sup>-1</sup>	tendency of atmosphere mass content of organic matter dry aerosol due to net production and emission. This is the sum of total emission of POA and total production of SOA (see next two entries). "Mass" refers to the mass of organic matter, not mass of organic carbon alone.	This should only be reported if POA and SOA cannot be separately reported.	emioa	tendency_of_atmosphere_mass_content_of_particulate_organic_matter_dry_aerosol_due_to_net_chemical_production_and_emission
1	Emission Rate of Dry Aerosol Primary Organic Matter	kg m <sup>-2</sup> s <sup>-1</sup>	<b>tendency of atmosphere mass content of primary organic aerosol due to emission:</b> "mass" refers to the mass of primary organic matter, not mass of organic carbon alone.	In a previous message you said production referred to SOA, not POA, so I've removed "production" here and only use "emission". Is this o.k.?	emipoa	tendency_of_atmosphere_mass_content_of_primary_particulate_organic_matter_dry_aerosol_due_to_emission
1	Production Rate of Dry Aerosol Secondary Organic Matter	kg m <sup>-2</sup> s <sup>-1</sup>	tendency of atmosphere mass content of secondary organic matter_dry aerosol due to net production: If model lumps SOA emissions with POA, then the sum of POA and SOA emissions is reported as POA emissions. "mass" refers to the mass of primary organic matter, not mass of organic carbon alone.		chepsoa	tendency_of_atmosphere_mass_content_of_secondary_particulate_organic_matter_dry_aerosol_due_to_net_chemical_production
1	Emission Rate of Black Carbon Aerosol Mass	kg m <sup>-2</sup> s <sup>-1</sup>			emibc	tendency_of_atmosphere_mass_content_of_black_carbon_dry_aerosol_due_to_emission
3	Dry Deposition Rate of Dry Aerosol Organic Matter	kg m <sup>-2</sup> s <sup>-1</sup>	tendency of atmosphere mass content of organic dry aerosol due to dry deposition: This is the sum of dry deposition of POA and dry deposition of SOA (see next two entries). "Mass" refers to the mass of organic matter, not mass of organic carbon alone.	This should only be reported if POA and SOA cannot be separately reported.	dryoa	tendency_of_atmosphere_mass_content_of_particulate_organic_matter_dry_aerosol_due_to_dry_deposition
3	Dry Deposition Rate of Dry Aerosol Primary Organic Matter	kg m <sup>-2</sup> s <sup>-1</sup>			drypoa	tendency_of_atmosphere_mass_content_of_primary_particulate_organic_matter_dry_aerosol_due_to_dry_deposition
3	Dry Deposition Rate of Dry Aerosol Secondary Organic Matter	kg m <sup>-2</sup> s <sup>-1</sup>			drysoa	tendency_of_atmosphere_mass_content_of_secondary_particulate_organic_matter_dry_aerosol_due_to_dry_deposition
3	Dry Deposition Rate of Black Carbon Aerosol Mass	kg m <sup>-2</sup> s <sup>-1</sup>			drybc	tendency_of_atmosphere_mass_content_of_black_carbon_dry_aerosol_due_to_dry_deposition
3	Wet Deposition Rate of Dry Aerosol Organic Matter	kg m <sup>-2</sup> s <sup>-1</sup>	tendency of atmosphere mass content of organic matter dry aerosols due to wet deposition: This is the sum of wet deposition of POA and wet deposition of SOA (see next two entries). "Mass" refers to the mass of organic matter, not mass of organic carbon alone.	This should only be reported if POA and SOA cannot be separately reported.	wetoa	tendency_of_atmosphere_mass_content_of_particulate_organic_matter_dry_aerosol_due_to_wet_deposition
3	Wet Deposition Rate of Dry Aerosol Primary Organic Matter	kg m <sup>-2</sup> s <sup>-1</sup>			wetpoa	tendency_of_atmosphere_mass_content_of_primary_particulate_organic_matter_dry_aerosol_due_to_wet_deposition

**In CMOR Table aero: 3-D aerosol-related concentrations and properties on model levels**

Report 1-year samples for years: 1850, 1870, 1890, ..., 1950, 1960, 1970, ... 2000 of the historical run, and 2010, 2020, 2040, 2060, 2080, 2100 of the RCP runs. For AMIP runs, report 1-year samples every 10 years (1980, 1990, ..., 2010). For 2030 time-slice run, report 1-year sample for year 2035. For decadal runs, report 10th year only for 10-year predictions or hindcasts, and report year 10, 20, and 30 for 30-year predictions and hindcasts. Also report years 2010, 2011, and 2012 for years with hypothetical volcanic eruption in 2010. For the preindustrial control, report the years that correspond to years 1850, 1870, 1890, ..., 1950, 1960, 1970, ... 2000 of the historical run and years 2010, 2040, 2060, 2080, & 2100 of the RCP runs.

**CMOR Table day: Daily Mean Atmosphere, Ocean and Surface Fields**

day

day

(saved on the model's atmospheric or ocean grid, as appropriate)

**In CMOR Table day: 2-D daily mean atmospheric and surface fields****The following daily mean variables should be collected for all simulations (for each ensemble member and the full duration of each experiment).**

<i>priority</i>	<b>long name</b>	<b>units</b>	<b>comment</b>	<b>questions &amp; notes</b>	<b>output variable name</b>	<b>standard name</b>
1	Near-Surface Specific Humidity	1		normally, report this at 2 meters above the surface	huss	specific_humidity
1	Daily Minimum Near-Surface Air Temperature	K		normally report this at 2 meters above the surface	tasmin	air_temperature
1	Daily Maximum Near-Surface Air Temperature	K		normally report this at 2 meters above the surface	tasmax	air_temperature
1	Near-Surface Air Temperature	K		normally report this at 2 meters above the surface	tas	air_temperature
1	Precipitation	kg m <sup>-2</sup> s <sup>-1</sup>	at surface; includes both liquid and solid phases from all types of clouds (both large-scale and convective)		pr	precipitation_flux
1	Sea Level Pressure	Pa			psl	air_pressure_at_sea_level
1	Daily-Mean Near-Surface Wind Speed	m s <sup>-1</sup>		normally report this at 10 meters above the surface	sfcWind	wind_speed
1	Square of Sea Surface Temperature	K <sup>2</sup>	square of temperature of liquid ocean, averaged over the day.	Report on the ocean grid. This variable appears in WGOMD Table 2.2	tossg	square_of_sea_surface_temperature
1	Sea Surface Temperature	K	temperature of liquid ocean. Note that the correct standard_name for this variable is "sea_surface_temperature", not "surface_temperature", but this was discovered too late to correct. To maintain consistency across CMIP5 models, the wrong standard_name will continue to be used.	Report on the ocean grid. This variable appears in WGOMD Table 2.2	tos	surface_temperature
1	Daily Maximum Ocean Mixed Layer Thickness Defined by Mixing Scheme	m		Report on the ocean grid. This variable appears in WGOMD Table 2.2	omldamax	ocean_mixed_layer_thickness_defined_by_mixing_scheme

K	time: mean		real	longitude latitude time	tos	ocean		area: areacello		
m	time: maximum		real	longitude latitude time	omldamax	ocean		area: areacello		

The rest of the daily mean fields on this spreadsheet should be collected only for a single ensemble member of the following experiments.

experiment	time-period requested
pre-industrial controls	20 years, preferably corresponding to years 1986-2005 of the historical run
historical	Jan 1950 -- Dec 2005
future simulations driven by RCP concentrations or emissions	only years 2006-2100, 2181-2200, and 2281-2300
AMIP & 2030 time-slice run	all years

In CMOR Table **day**: *2-D daily-mean atmospheric and surface fields* (All fields should be reported on the atmospheric grid except (as noted below) the sea ice fields, which should be reported on the ocean grid.)

priority	long name	units	comment	questions & notes	output variable	
					name	standard name
1	Moisture in Upper Portion of Soil Column	kg m <sup>-2</sup>	the mass of water in all phases in a thin surface soil layer.	integrate over uppermost 10 cm	mrsos	moisture_content_of_soil_layer
1	Near-Surface Relative Humidity	%	This is the relative humidity with respect to liquid water for T> 0 C, and with respect to ice for T<0 C.	normally report this at 2 meters above the surface	rhs	relative_humidity
1	Surface Daily Minimum Relative Humidity	%	This is the relative humidity with respect to liquid water for T> 0 C, and with respect to ice for T<0 C.	normally report this at 2 meters above the surface	rhsmin	relative_humidity

**CMOR Table 3hr: 2-D Atmospheric and Surface Fields Sampled Every 3 Hours****3hr****3hr**

All fields are saved on the atmospheric grid. Precipitation, clouds, and all flux variables are averaged over 3-hour intervals (0-3Z, 3-6Z, 6-9Z, 9-12Z, 12-15Z, 15-18Z, 18-21Z, 21-24Z). All other fields are sampled synoptically at 0Z, 3Z, 6Z, 9Z, 12Z, 15Z, 18Z, and 21Z.

The 3-hourly data should be collected only for the following experiments and years:

	experiment	time-period requested
	decadal hindcasts/forecasts (but very low priority)	all years
historical		Jan 1960 - Dec 2005
AMIP & future 2030 time-slice		all years
future simulations driven by RCP concentrations or emissions		Jan 2026 - Dec 2045, Jan 2081-Dec 2100, 2181-2200, and 2281-2300
pre-industrial control		30 years (ideally the years corresponding to years 121-150 of abrupt 4XCO <sub>2</sub> run)
1 percent per year CO <sub>2</sub>		last 30 years
control SST climatology (6.2a)		all years
CO <sub>2</sub> forcing (6.2b), anthropogenic aerosol forcing (6.4a), and sulfate aerosol forcing (6.4b)		all years
abrupt 4XCO <sub>2</sub> (6.3)		first 5 years and years 121-150
abrupt 4XCO <sub>2</sub> ensemble (6.3-E)		all years

**CMOR Table cfMon: CFMIP Monthly-Mean Cloud Diagnostic Fields**  
**(All Saved on the Atmospheric Grid)**

cfMon

mon

For further guidance, please see [see http://cfmip.metoffice.com](http://cfmip.metoffice.com)

The spread sheet "CFMIP output" specifies the simulations and time-periods for which the cloud diagnostic fields listed on this spread sheet should be saved.

In CMOR Table cfMon: "**CFMIP monthly 3D**--monthly mean 3-D fields on model levels (or half levels in the case of fluxes). Different GCMs will have different cloud tendency terms due to different model formulations. Please submit the terms which are necessary to close the stratiform cloud water budget of your model. If your model contains terms not listed here, please email [mark.webb@metoffice.gov.uk](mailto:mark.webb@metoffice.gov.uk) to request an update to the table.

**CMOR Table cfOff: "CFMIP monthly offline" Cloud Diagnostic Fields**  
**(All Saved on the Atmospheric Grid)**

cfOff

mon

For further guidance, please see <http://cfmip.metoffice.com>

The spread sheet "CFMIP output" specifies the simulations and time-periods for which the cloud diagnostic fields listed on this spread sheet should be saved.

**CMOR Table cfOff: "CFMIP monthly offline" -- monthly mean CloudSat/CALIPSO/PARASOL simulator output**

(Calculate monthly means by averaging the orbital curtain output from CFMIP\_orbital\_offline. The difference between similar variables appearing in this and the previous table is in the spatial sampling and time period requested. The previous table builds monthly means from global fields, whereas this table below uses only data along the satellite track for a short period of time (one year). This will enable studies of the impact of the satellite sampling in the comparisons.)

**CMOR Table cfSites: CFMIP high frequency Cloud Diagnostic Fields**  
**(sampled only at specified locations)**

cfSites

subhr

For further guidance, please see <http://cfmip.metoffice.com>

The spread sheet "CFMIP output" specifies the simulations and time-periods for which the cloud diagnostic fields listed on this spread sheet should be saved.

**CMOR Table cfSites: "CFMIP Timestep Station Data" -- 2-D fields from the Amon table and 3-D fields on model levels sampled at 20 to 30 minute intervals at 73 specified locations for aquaplanet experiments and 119 specified locations for other experiments (see <http://cfmip.metoffice.com/cfmip2/pointlocations.txt>). Note that the column labeled "CMOR dimensions" indicates that these variables are a function of longitude and latitude. When writing the data to the netCDF file, however, the axis for the 119 (or 73) locations will be a simple index named "site", and CMOR defines this as a "grid axis" that has associated longitudes and latitudes. See CMOR documentation for instructions on defining a 1-dimensional grid axis of this kind.**

The sampling interval should be the integer multiple of the model time-step that is nearest to 30 minutes and divides into 60 minutes with no remainder. e.g. (30->30,20->20,15->30,10->30). Outputs should be instantaneous (not time mean) and from nearest gridbox (no spatial interpolation.) Note that except for the quantities appearing in the Amon spreadsheet (first line of table below), all other fields are 3-D.

priority	long name	units	comment	questions & notes	output variable name	standard name

## cfSites

Note that the CF convention and CMOR2 require that this field will be included in each file that contains a variable that is a function of the "site" dimension, so there is no need to save this field by itself. It is included here simply to indicate that longitudes should be stored for the site grid in each file written.

1	Longitude	degrees_east	lon	longitude
1	Latitude	degrees_north	lat	latitude

degrees\_east

real site longitude atmos

degrees\_north

real site latitude atmos

Requested output: years requested for each expt./output table combination (see CFMIP output sheet for information on time-periods for saving the special CFMIP-focused output.

red font means output should be reported for only a single member in the case of an ensemble of simulations

blue font means this is a lower priority request

If a cell is shaded yellow/tan, none of the variables will be part of the subset of model output that will be replicated at several locations (except, as noted by * or ** -- see note at right-- this may apply only to lower priority variables)	"all*" indicates that although all <i>years</i> will be included in the "replicated" subset, only the high and medium priority <i>variables</i> will be included in the replicated subset. "all**" indicates that although all <i>years</i> will be included in the "replicated" subset, only the highest priority <i>variables</i> will be included in the replicated subset
