1. Answer the following questions about the Handshaking Lemma.

   (a) Prove that in every simple graph, there are an even number of vertices of odd degree. *Hint: Use the Handshaking Lemma.*

   (b) Conclude that at a party where some people shake hands, the number of people who shake hands an odd number of times is an even number.

   (c) Call a sequence of two or more different people at the party a *handshake sequence* if, except for the last person, each person in the sequence has shaken hands with the next person in the sequence.

   Suppose George was at the party and has shaken hands with an odd number of people. Explain why, starting with George, there must be a handshake sequence ending with a different person who has shaken an odd number of hands.

   *Hint: Just look at the people at the ends of handshake sequences that start with George.*
