FIND THE PATH THAT’S RIGHT FOR YOU

Earth & Planetary Sciences
Environmental Science & Engineering
Environmental Science & Public Policy
Integrative Biology
Environmental Sciences at Harvard integrates the physical and biological sciences to study the natural world and provide solutions to environmental problems. It is a highly interdisciplinary field that encompasses a range of scientific disciplines. At Harvard these disciplines are divided into four concentrations. Each concentration/department has its own unique focus and skills but all provide a key perspective on the environment.

Earth and Planetary Sciences (EPS)
Environmental Science and Engineering (ESE)
Environmental Science and Public Policy (ESPP)
Integrative Biology (IB)

The most effective way to learn about possibilities and opportunities each concentration offers is to contact them directly—and early on so they can work with you to design the best plan of study. Use this handbook as your starting point to find out about requirements, areas of study, and culture; then using the contact information found in each chapter reach out to the head tutors and undergraduate administrators to learn more. There is a wide range of possibilities for students interested in the environment and we look forward to helping you find the path that’s right for you.
COURSE SEQUENCE RECOMMENDATIONS

The chart below lists courses each environmental science concentration recommends students consider taking within their first three terms at Harvard. Every student’s plan of study and trajectory is different so we encourage you to contact the departments directly for advice on course selection.

HARVARD ENVIRONMENTAL SCIENCES
These are intellectually exciting times for the Earth and planetary sciences, which are of unprecedented importance to contemporary society. Our environment is increasingly subject to stresses placed upon it. As never before, we have an imperative to better understand the consequences of human activities for the Earth’s atmosphere, the oceans, the solid Earth, and the organisms that live on it. Exploring for, extracting, and conserving natural resources are vital to the global political economy. We must mitigate the ill effects of earthquakes, landslides, volcanic eruptions, and climate change by learning to predict their time and place. Moreover, new technologies, datasets and computational capacity are allowing us to better understand the functioning of Earth systems and the interplay between tectonics, climate, and life.

WHY EARTH AND PLANETARY SCIENCES?

The field of Earth and Planetary Sciences (EPS) deals with questions that require a combination of scientific innovation, deep understanding, and an interdisciplinary approach involving all the core sciences. EPS’s research environment is an unparalleled resource for undergraduate education. Concentrators may work with faculty and graduate students on major research projects as a research or field assistant, in the context of course work, or as part of an undergraduate research project. Class sizes are small and student-professor contact is frequent and informal. Students are encouraged to participate in department-sponsored field trips; experiences that build a tight-knit community among undergraduates, graduate students, and faculty. By the time they graduate, each EPS concentrator has become personally acquainted with numerous faculty members in the department, and many complete their studies with a senior thesis based on original research. Earth and Planetary Sciences provides a challenging and sophisticated environment with many career opportunities in the private sector, government, and academic research.

WHY EARTH AND PLANETARY SCIENCES?

...we have an imperative to better understand the consequences of human activities for the Earth’s atmosphere, the oceans, the solid Earth, and the organisms that live on it.

EPS OFFERS:

- A science that addresses important societal challenges
- A mid-size department, accessible and friendly
- High faculty to student ratio
- Individual faculty advisor for each EPS concentrator
- Flexible course of study
- Training in the basic sciences leading to focused study in selected subfields
- World-wide summer field research camps and January field experiences
- Research/lab opportunities and summer internships with funding
- Opportunities to conduct original research with guidance from EPS faculty, resulting in a senior thesis

ACTIVITIES:

- Department-sponsored field trips:
  - Canadian Rockies, Hawaii, and sailing off the coast of California or Massachusetts
- Weekend field trips to geological sites
- Seminars/tutorials/special presentations
- Opportunities for informal interaction with faculty and students
- Daily 3:00 pm cookies and tea, weekly Friday 5:00 pm pizza
- GeoSociety: a student-run organization whose activities complement the work in and out of the classroom.

To learn more contact Matt Luongo (mluongo@college.harvard.edu) or Mickey MacKie (emackie@college.harvard.edu).
WHY I CHOSE EPS

As someone who was (and still is) unsure about what I want to do professionally, the EPS department appealed to me for several reasons. First, the mechanisms at the core of Earth science are diverse, complex, and have a direct and observable impact on anyone who happens to live on this planet. There are still so many unanswered questions in this field that groundbreaking discoveries could honestly be made by anyone at any time, which is a great motivator for an aspiring young scientist. The incredible departmental field trips are a huge plus, giving our scientists—in-training a taste of what it means to do Earth science in a hands-on setting. Above all, I have to say the people in the department are what really set EPS apart from the other concentrations. Staff are helpful and responsive, professors are always available and eager to chat, and classmates are supportive and friendly. You really can't go wrong choosing EPS.

NEAL CHAMPAGNE '17
EPS PRIMARY

I entered Harvard expecting to study biology. However, a fortuitous encounter with the EPS department at Advising Fortnight uncovered my hidden interests in the environment. I value EPS for the people and the opportunity to explore different subjects through classes, research, and the end-of-summer trips. Earth and planetary sciences as a field is multidisciplinary, so the chance to take classes in areas ranging from climate to geobiology is a real treat that I would not have with other departments. The department is fairly small, so it's fun to get to know professors, staff, and students. I see the same people regularly in many classes and during GeoSoc lunches, and I go with them to places like Hawaii and the Canadian Rockies. Lastly, every time I reach out for help with classes or post-graduation questions, I always find some form of guidance from the faculty and staff. Everyone is willing to give me advice or point me in the right direction. EPS has helped me dramatically in my personal growth in college, and I can honestly say that I am glad to have stumbled upon it.

CAROLINE JUANG '17
EPS PRIMARY

I stumbled upon EPS by mistake—a fortuitous mistake. Before even enrolling in an introductory class, I was swept away on a summer field trip to Hawaii with 45 other like-minded, incredible individuals who have since become some of my closest friends at Harvard. Over the past year, EPS has continued to evolve into an unparalleled facet of my academic and social experience. It's the small things that set EPS apart—the yearly SWAG that has my closet decorated with EPS flannels, hats, and fleece vests; the free coffee and cookies in Hoffman Lounge that have me spending way more hours in the department than I should be; the ample opportunities to work alongside faculty through small, intimate classes, frequent office hours, and lab assistant positions; the GeoSoc club that brings students together for social gatherings when we're finished with—or procrastinating—problem sets. EPS has a niche for everyone, whether you're interested in solid earth tectons and geology, the fluid earth and climate sciences, or just a challenging concentration with incredible people, unbelievable travel experiences, dedicated professors and administrators, and a true sense of family and comfort.

FORREST LEWIS '17
JOIN EPS-ESPP

When my love for biology led me to choose EPS as a secondary field rather than a primary concentration, I worried that I wouldn't get to engage in the department in a meaningful way. I couldn't have been more wrong. The EPS department and its social group, the GeoSoc, have become a second family for me. No other department can provide the deep bonding and camaraderie that EPS does through fun labs, engaging and challenging classes, and travel and research opportunities. They have taken me to incredible locales, such as Argentina, Hawaii, the Grand Canyon (where I found my first fossil), and the Canadian Rockies to study the geology of my home. Every class and trip has been under the guidance of attentive, capable, and relatable faculty and administration, and there is ample opportunity to engage in research with professors and graduate students. The wide variety of EPS courses allows me to combine my interest of biology and geology in a way I never thought possible. The department is, without a doubt, the best kept secret at Harvard (and the best dressed, in matching flannel shirts).

KAITLYN GIBSON '17
EPS SECONDARY
ORGANISMIC & EVOLUTIONARY BIOLOGY PRIMARY

I had aspirations for Law School and politics, only to take my first government class and hate every minute of it. Only after this sad reality did I allow myself to study something I have always been passionate about: rocks. This is where I found the hidden gem that is EPS. I asked my EPS advisor during our first meeting why he studied the Earth. He told me what he asked himself when he entered college: “Do I want to read about history, or make it?” From that question forward, I have been exploring all that the department offers. What’s more, the faculty in EPS are the best I have had the pleasure of knowing at Harvard. I once joked to the EPS Academic Administrator that I would “suffer through chemistry for her,” but it was so much more that. This department has consistently challenged me and made me love rocks and minerals even more intensely. I truly love the EPS department. I came for the rocks, but I stayed for the validating feeling that EPS is where I belong—thanks to the people and the experience.

MATTIE NEWMAN '17
JOIN EPS-ESPP

I couldn't have been more wrong. The EPS department and its social group, the GeoSoc, have become a second family for me. No other department can provide the deep bonding and camaraderie that EPS does through fun labs, engaging and challenging classes, and travel and research opportunities. They have taken me to incredible locales, such as Argentina, Hawaii, the Grand Canyon (where I found my first fossil), and the Canadian Rockies to study the geology of my home. # EARTH AND PLANETARY SCIENCES COURSE SEQUENCE

Because the Earth’s natural systems (atmosphere, ocean, biosphere, solid earth) are interconnected, the training of Earth and planetary scientists broadly spans the boundaries between biology, chemistry, engineering, physics, mathematics, and the Earth sciences themselves, and provides a broad intellectual foundation that is beyond what is typically possible in a “pure” science program. The department trains students rigorously in the basic sciences, typically in the same foundational courses as students in Astrophysics, Chemistry, Engineering Sciences, and Physics. These foundational courses are followed by upper-level courses that focus on disciplines within Earth and planetary sciences.

To facilitate and reinforce our interdisciplinary vision, students are required to take at least one course in each of the three major sub-disciplines in the department: Oceans and Atmospheres; Geobiology and Earth History; and Geology, Geophysics and Planetary Science.

The chart below lists courses EPS recommends students consider taking within their first three terms at Harvard. Each student’s plan of study and trajectory is different so we encourage you to contact us directly for advice on course selection.

HARVARD ENVIRONMENTAL SCIENCES
EARTH AND PLANETARY SCIENCES SECONDARY REQUIREMENTS
5 COURSES + DEPARTMENT TUTORIAL

The EPS secondary field is intended to provide a strong foundation in one or more subfields of Earth science (Atmospheric and Ocean Science, Energy and Climate, Environmental Geoscience, Geobiology, Geochemistry, Geology, Planetary Sciences, and Solid Earth Geophysics) to students who have sufficient preparation in physics, chemistry, and mathematics. Secondary field students are required to take the departmental tutorial, an ongoing series of lectures by faculty scheduled periodically through the academic year.

2 FOUNDATIONAL COURSES
A minimum of 2 foundational courses from either EPS 10 or SPU 12, 14, 25, 29, 30, and 31, and all 50-level EPS courses.
NB: No more than one of these from EPS 10 or SPU 12, 14, 25, 29, 30 or 31.

DEPARTMENT TUTORIAL  Non-credit.
Generally taken in the first year of declaring. Need to attend five EPS tutorials. Non-credit.
Schedule for 2016-2017:
- OCTOBER 5
- NOVEMBER 2
- DECEMBER 7
- FEBRUARY 1
- MARCH 1
- APRIL 5
**WHERE YOUR EPS DEGREE CAN TAKE YOU**

**MEDICAL DOCTOR**  
**DANNY KIM ’10**  
**4TH YEAR MD/MPH STUDENT, UCSF SCHOOL OF MEDICINE, PRIME-US**  
I chose to study EPS for a couple reasons: content and community. One, as a pre-med, I liked that my EPS courses covered requirements for applying to medical school, but I could expand my horizons with interesting chemistry courses that engaged with the Earth and our environment. Two, the sense of community within EPS is quite special. The annual field trips and frequent pizza parties are so fun and helped build a lot of friendships. It makes a huge difference when you can take classes (and still meet medical school course requirements) with friends who seek to grasp and enjoy the material—as opposed to more traditional “pre-med” science courses where some of my peers seemed more intent on achieving grades.

**POLICY ADVISOR**  
**KATE TOMFORD ’99**  
**CHIEF SUSTAINABILITY POLICY ADVISOR ILLINOIS ENERGY OFFICE ILLINOIS DEPARTMENT OF COMMERCE AND ECONOMIC OPPORTUNITY**  
As a freshman at Harvard in 1996, I chose to concentrate in Earth and Planetary Sciences to pursue interests I had developed through a summer geology and glaciology field course that I attended in Alaska during high school. Concentrating in EPS provided me with opportunities to take courses across a variety of science departments at Harvard, to interact closely with professors in small classes, and to learn through hands-on experiences in the field, geochemistry labs, and computer labs. Perhaps most importantly for my job today as a policy advisor for the State of Illinois, EPS gave me a comprehensive understanding of the complex interdependencies among the Earth’s physical, chemical, and biological systems. Policymakers are constantly challenged to design regulations and programs based on their interpretation of scientific results, and EPS is an excellent foundation for this work in the dynamic fields of energy, climate, and environmental policy.

**PORTFOLIO MANAGER**  
**ARTHUR WHITE ’94, PHD**  
I did not know my ideal job nor the trajectory I would follow when I entered my first year at Harvard. I chose what I was most interested in pursuing, while always keeping a thought to what I might be able to do next. After surviving Prof. Brian Wernicke’s Introduction to Geological Sciences, spring 1991, I realized that a geology concentration with EPS, offered me a chance to think about some of the really big questions governing the mechanics of our world while combining scientific discipline with outdoor adventure. I was thrilled. My senior-year thesis with Prof. Ulrich Petersen on ore deposits in South America led to a PhD opportunity to study the orogenic evolution of the East Greenland Caledonides. Subsequently, I found myself transitioning from academia back to finance, and now I am a portfolio manager overseeing a book of complex investments in the natural resource, energy, and commodity space.

**EPS gave me an understanding of the complex interplay of climate, energy, and geological systems, which allows me to assess climate and energy policies and discussions in their full context.**
HIGH SCHOOL SCIENCE TEACHER
DAVID OLESH ’06
I chose EPS for two reasons: great people and great field trips. The professors and students in the department formed a true community within Harvard, something rare in the undergraduate’s academic world. The field trips cemented the community feeling and gave us a glimpse of the awesome diversity of forms and processes over the natural world. As a kid from a paved over city, EPS taught me a lot. Now I share the spirit and knowledge I gained in EPS with a new generation of environmental scholars as an Earth Science teacher in a New York City high school.

LANDSCAPE ARCHITECT
TIM WONG ’05
I entered Harvard with a love of the outdoors, so it was natural for me to choose EPS as my concentration. My classes in geology taught me how to study the land: an often neglected skill nowadays. After graduation I worked at an environmental consulting firm, cleaning up oil spills and doing environmental assessments. Then I entered graduate school to study landscape architecture, which is the practice of designing parks and outdoor spaces. My background in Earth Science has allowed me to make designs that meld with the land and the natural environment.

GRADUATE STUDENT
PATRICIA LEVI ’12
MASTERS OF SCIENCE
GRADUATE STUDENT, TECHNOLOGY AND POLICY MIT
I found EPS at the end of a long search for a concentration that would allow me to explore my interest in climate change science as well as policy. The small class sizes, opportunities for awesome field trips, and, especially, the tight-knit community of the department made it an absolute joy to be an EPS concentrator. I currently work on climate change through the lens of electricity policy and regulation, with a current focus on rural electrification in India as part of my graduate studies. I constantly draw on what I learned as an EPS student.

EPS gave me an understanding of the complex interplay of climate, energy, and geological systems, which allows me to assess climate and energy policies and discussions in their full context. The background I received in the basic sciences and math has allowed me to pick up new expertise—from microgrid design to renewable energy finance—with relative ease. Through my research in EPS, I also gained a deep appreciation for how scientific knowledge is created, which is invaluable in thinking about how such knowledge can be best communicated to and used by policymakers to craft sound policy.

PROFESSOR
JENNIFER SMITH ’96
DEAN OF THE COLLEGE OF ARTS AND SCIENCES
ASSOCIATE PROFESSOR OF EARTH AND PLANETARY SCIENCES AND ENVIRONMENTAL STUDIES
WASHINGTON UNIVERSITY IN ST. LOUIS
What drew me initially to EPS was the desire to do science outside; to apply the fundamentals of chemistry, physics, and biology to the integrated study of the natural world. My interest in the historical (and prehistorical) context for the environmental challenges we face today led me to graduate school, where I studied climate-driven changes in water resource availability over the past few hundred thousand years in Egypt. I continue to pursue similar studies (in Sudan, Iraq, and Syria, among other places) as a professor.

EPS CAREERS:
Common employment for graduates with EPS degrees include:

- Education: Teaching at the elementary school through university level
- Legal: Environmental litigation or support in a government agency such as the US Environmental Protection Agency
- Research: Research at university, non-profit, and governmental research facilities
- Public Service: Environmental monitoring and analysis, operation and management of environmental facilities, administration of environmental regulations
- Medical/Veterinary: an EPS degree will prepare you for a career in the medical or veterinary realms

Water treatment facility

Group of students and faculty

Research facility

Heat map of environmental data
Our society’s influence on the natural world’s ecosystems and resources has never been more prominent or problematic than it is today. In order to better understand and address environmental challenges, environmental scientists and engineers provide technical solutions and advance innovations in environmental measurements, modeling, and control through the application of scientific and engineering principles.

Harvard has long been a pioneer in environmental education and research. This tradition continues today with faculty that are committed to teaching and researching engineered solutions to problems in the atmospheric, terrestrial, and aquatic compartments of the environment.

Undergraduate research and design projects in Environmental Science and Engineering cut across departments and schools, and cover topics in environmental technology, atmospheric sciences, environmental chemistry, pollutant cycling and toxicology, microbiology, energy, climate, and oceanography.

Students in Environmental Science and Engineering (ESE) study the fundamental processes and technologies underlying environmental systems, including natural and polluted waters and soils, the atmosphere, climate, and energy. Students learn to apply these principles to develop solutions to complex environmental problems and to mitigate human impacts on the environment.

Students interested in Environmental Science & Engineering have the option to pursue the ESE track of a Bachelor of Arts (A.B.) in Engineering Sciences or an ABET-accredited Bachelor of Science (S.B.) in Engineering Sciences. While students in either degree program take many of the same upper-level ESE courses, the A.B. program offers the opportunity to study complementary disciplines from other natural and social sciences, and the S.B. program provides a broader basis in engineering fundamentals with courses from other engineering areas and design. The broad-based, multidisciplinary curriculum of the Engineering Sciences concentration offers rigorous preparation for students planning to work as practicing engineers or researchers, entering graduate school, and for those preparing for careers in business, education, government, or law. The program’s structure encourages students to make the most of Harvard’s resources, such as taking courses in other departments, collaborating with researchers from other fields or schools, and taking advantage of the wealth of extracurricular activities available.

WHY ENVIRONMENTAL SCIENCE & ENGINEERING?

Students in Environmental Science and Engineering (ESE) study the fundamental processes and technologies underlying environmental systems, including natural and polluted waters and soils, the atmosphere, climate, and energy. Students learn to apply these principles to develop solutions to complex environmental problems and to mitigate human impacts on the environment.

ESE OFFERS:

- The opportunity to pursue the technical depth of an engineering degree within the liberal arts and residential life setting of Harvard College
- A direct connection to the cutting-edge research at the Harvard John A. Paulson School of Engineering and Applied Sciences (SEAS) including undergraduate research opportunities during the regular term and over the summer
- An individual senior capstone design project for all S.B. students, and the opportunity for A.B. students to conduct original research with guidance from SEAS faculty resulting in a senior thesis
- Small classes that give students direct access to professors
- A dedicated advising team for each student, including an individual faculty adviser and the Associate Director of Undergraduate Studies in Environmental Science and Engineering
- Opportunities to learn outside of the classroom through extracurricular activities. For example, Engineers Without Borders is working to improve drinking water quality for a community in the Dominican Republic, and all SEAS students are eligible to apply for Nectar Funding Grants to support their independent co-curricular initiatives in engineering and applied science

ENVIRONMENTAL ENGINEERS USE SCIENTIFIC AND ENGINEERING PRINCIPLES TO:

- Protect human health from adverse environmental conditions
- Protect local and global environments from deleterious effects of human activities
- Measure, model, and improve environmental quality
- Evaluate and model climate change and climate/energy interactions
WHY I CHOSE ESE

The reason I chose this concentration is that not only is it the smallest track within the engineering department (allowing all the students to know each other as well as the professors) but it is one of the most flexible concentrations. I can take my electives with the Earth and Planetary Sciences Department, which in itself is such a small concentration allowing students to take advantage of a large number of resources. The subject itself is of great interest since I would like to have the skills in the future to get involved in environmental engineering projects, particularly those in underdeveloped countries. In the future, I would like to work on development projects that provide clean energy to rural areas in under-developed countries with scarce resources.

LAILA KASURI ’13
ESE PRIMARY

I choose ESE because I wanted to learn about issues concerning the environment from an engineering perspective. I am interested in learning the problems facing the environment and how we as engineers can help solve them.

ALISON LEE ’12
ESE PRIMARY

I chose ESE for a number of reasons. First of all, I was interested in environmental science and climate issues in general when I was initially looking at and applying to colleges, and I knew that I wanted to study them at a more advanced level. But I think the real appeal of ESE for me was the hands-on, applied aspect that engineering offers. I learn better with labs and when I understand the applications of what I’m learning about to the real world. ESE offers a really great combination of all those things, which made it a really ideal concentration for me.

CAROLINE QUAZZO ’12
ESE PRIMARY

I chose ESE because of its future. There are so many important decisions to be made about energy and resources in the near future and I want to be a part of it. I chose ESE because it is a constantly changing field, bringing forth new problems and it is our job to create the solutions.

SARAH CAMPBELL ’12
ESE PRIMARY

I joined ESE because I wanted to go into business and wanted the technical background to succeed in the green tech industry. With Harvard’s engineering department, as well as the University’s myriad opportunities, I was able to explore technological advances in the environmental field. Harvard treats its engineers well, with food, mentorship, and a small but growing community. I’m proud to be a Harvard engineer!

HEIDI LIM ’14
ESE PRIMARY

I have chosen to concentrate in ESE for three main reasons. ESE is: (1) Exciting because it is a new and developing engineering field—combining a variety of classic engineering disciplines with developing social questions that will define important global decisions in the coming decades; (2) Professionally significant because governments and companies alike are focusing increasing efforts on environmental considerations; (3) Socially responsible because the conservation and proper use of Earth’s environment has become one of the world’s most important moral questions.

GREGORIO GOMEZ ’15
ESE PRIMARY

“I am interested in learning the problems facing the environment and how we as engineers can help solve them.”

LAILA KASURI ’13
ESE PRIMARY

I choose ESE because I wanted to learn about issues concerning the environment from an engineering perspective. I am interested in learning the problems facing the environment and how we as engineers can help solve them.

ALISON LEE ’12
ESE PRIMARY

I chose ESE for a number of reasons. First of all, I was interested in environmental science and climate issues in general when I was initially looking at and applying to colleges, and I knew that I wanted to study them at a more advanced level. But I think the real appeal of ESE for me was the hands-on, applied aspect that engineering offers. I learn better with labs and when I understand the applications of what I’m learning about to the real world. ESE offers a really great combination of all those things, which made it a really ideal concentration for me.

CAROLINE QUAZZO ’12
ESE PRIMARY

I chose ESE because of its future. There are so many important decisions to be made about energy and resources in the near future and I want to be a part of it. I chose ESE because it is a constantly changing field, bringing forth new problems and it is our job to create the solutions.

SARAH CAMPBELL ’12

ENVIRONMENTAL SCIENCE AND ENGINEERING COURSE SEQUENCE

The curriculum for the Engineering Sciences concentration is highly structured, with advanced courses building on the knowledge acquired in math, science, and introductory engineering coursework. ESE courses provide opportunities for students to receive rigorous training in engineering design, computer modeling, and mathematical, chemical, and biological analysis of natural systems, with examples drawn from aquatic, terrestrial, and atmospheric environments.

The chart below lists the recommended courses for potential ESE concentrators to consider taking within their first four terms at Harvard. Students are cautioned that it is more important to derive a solid understanding of these basic subjects than to complete them quickly without thorough knowledge, as this material is used extensively in many subsequent courses. Each student’s plan of study and trajectory through the curriculum is unique, so we encourage you to contact the Associate Director of Undergraduate Studies for advice on course selection.

| 9. ENGINEERING ELECTIVE | Select one course on engineering topics from any engineering depth area (see the Student Handbook for complete list of eligible courses) |
WHERE YOUR ESE DEGREE CAN TAKE YOU

ENVIRONMENTAL ENGINEER
MARY BOGGS ’06
An ESE degree has helped prepare me for a career in designing and applying remedial solutions to environmentally-hazardous scenarios across the country. The ESE degree helped me by teaching me the science/chemistry/physics behind the air, water, and soil, as well as how to think when attempting to design the solution. I am currently employed at Weston Solutions as an environmental engineer and so far, I have participated in air quality monitoring on the Louisiana Delta in the aftermath of the Deepwater Horizon Oil Spill, the characterization of a volatile organic carbon plume in a confined aquifer underneath the Aberdeen Proving Grounds in Maryland, the cleanup of lead dust in residences in a small borough in eastern Pennsylvania, and the conduction of a chemical inventory of unknown substances found in both abandoned warehouses and existing residences. I feel I am making a difference by helping the local and national communities in cleaning up our planet and solving these complex problems.

REMEDIATION CONSULTANT
JIM GRUNDY ’09
A degree from the ESE program gives you the technical background and writing skills to excel in the field of environmental remediation consulting. The focus on preparation of scientific reports and papers during the undergraduate ESE program translates well to writing of remedial specifications and regulatory reports, while the subjects learned in the ESE program give you the tools needed to solve remediation problems both in the office and in the field. The ESE program also teaches undergraduates time management and efficiency skills, which are very important skills for success in the competitive world of environmental consulting.

CORPORATE STRATEGY ANALYST
ZANDER SEBENIUS ’13
Spending four years in the ESE department helped me to develop the passion and tools necessary to change the way that we generate and consume energy. Since graduating in 2013, I have working in the Corporate Strategy Group at Flextronics, one of the largest electronics manufacturing companies in the world. I have applied my ESE-derived knowledge about renewable energy technology to help Flextronics develop its five-year energy business plan, develop a new LED lighting business, and create a new engagement model for Flextronics to work with innovative start-ups. Moreover, the rigorous ESE curriculum has trained me to problem solve effectively and venture into unexplored areas—in both science and business—with full confidence of success.

MANAGEMENT CONSULTANT
ALEXANDER PADDINGTON ’07
Since graduation I have been working in management consulting for Oliver Wyman in New York with an ESE degree, able to leverage quantitative background and branch out and work in financial services. I have focused on consulting to the largest financial services firms in the world on strategy, operational and risk concerns. I have also been able to leverage my engineering background for more quantitative projects, many involving complex Excel models including valuation of distressed RMBS and ABS securities.

ESE CAREERS:
Common employment sectors (with example job responsibilities) for graduates with ESE degrees include:

- Education and Research: Teaching at the high school through university level, cutting-edge environmental research at universities and government research centers
- Public Service: Environmental monitoring and analysis, operation and management of environmental facilities, administration of environmental regulations
- Engineering Consulting: Design of treatment facilities and remediation processes, investigations of pollutant transport, studies of energy efficiency and sustainability
- Industry: Evaluate and implement corporate environmental strategies and regulatory compliance
- Non-Governmental Organizations: Technical environmental projects to support the organization’s mission, public education and outreach, environmental policy advocacy

ENVIRONMENTAL SCIENCE & PUBLIC POLICY
The concentration in Environmental Science and Public Policy (ESPP) is designed to provide a multidisciplinary introduction to current challenges and issues of the environment. It is founded on the premise that the ability to form rational judgments concerning many of the complex challenges involving the environment that confront today’s society requires both an understanding of the underlying scientific and technical issues and an appreciation for the relevant economic, political, legal, historical, and ethical dimensions.

**WHY ENVIRONMENTAL SCIENCE & PUBLIC POLICY?**

All students have to satisfy a core of requirements in the physical, biological, and social sciences and mathematics. Concentrators in consultation with their advisor develop an individual plan of study for a series of advanced courses around a particular field of specialization. Through their field of specialization, students develop expertise in a particular field of study relating to the environment. In the senior year, students undertake a capstone project in which they conduct an in-depth examination of a particular environmental issue consistent with their field of specialization, applying skills and knowledge gained in their courses and tutorial experiences.

The concentration is overseen by a Committee on Degrees functioning as a Board of Tutors including representatives from several FAS Departments and from other Schools as appropriate to ensure the requisite breadth of the program. The faculty serve as concentration advisors, thesis advisors and are valuable resource for concentrators.

Our concentrators appreciate the breadth and flexibility of course requirements and their close interactions with faculty. Concentrators also enjoy being in the field, and we offer opportunities for concentrators to conduct work in the field in both course and group settings. We also support independent student research under faculty guidance.

**ESPP OFFERS:**

- Interdisciplinary approach to solving environmental problems
- Create and develop your field of specialization with faculty guidance
- All ESPP concentrators have an individual faculty advisor
- Wide range of career options
- Field trips for concentrators
- Flexible course offerings
- Many options for supervised independent student research projects
- Faculty oversight provided by faculty members from FAS (including the departments of EPS, Economics and OEB), the Business School, the Graduate School of Design, the Kennedy School of Government, the School of Public Health and the School for Engineering and Applied Sciences
- Faculty led Junior Tutorial/Seminar program with small class sizes and low student/faculty ratio. Topics include:
  - World Food Systems and the Environment
  - Structural Transformation of African Agriculture and Rural Spaces
  - Current Issues in U.S. Environmental Law
  - Climate Policy — Past, Present and Future
  - Planetary Health: Understanding the Human Health Impacts of Accelerating Environmental Change
  - Conservation Biology
  - Biotechnology, Sustainability and Public Policy
  - China’s Energy Economy: Perspectives from the Past: Challenges for the Future

“…designed to provide a multidisciplinary introduction to current challenges and issues of the environment.”
WHY I CHOSE ESPP

As a freshman, ESPP appealed to me as a concentration in which I could receive individual attention and guidance through an expansive set of resources spanning multiple departments. Upon declaring my concentration sophomore fall, it was clear to me that by fulfilling the ESPP degree requirements I would gain a broad education in the natural world and a deep understanding of how to analyze and solve problems surrounding our complex interactions with it. As I pursue a career in natural resource economics I take with me the invaluable experiences of the two ESPP 90 Seminars I have taken. These small, focused classes have afforded me the opportunity to interact with guest lecturers from across the globe—experts in innovation and technology, biotechnology and GMOs, environmental health, particulate air pollution, solid waste, and indoor air quality. In addition to discussing their work, these experts shared their experiences and career paths, providing advice that was as valuable as the cutting-edge research they shared with us.

ETHAN ADDICOTT ’14
ESPP PRIMARY

What I value most about my ESPP experience are the relationships I formed. The sense of community and the opportunities to connect with peers in the lab and in intimate seminars enabled me to find mentors among my professors and close friends among my classmates.

In my experiences in private and public sector work environments since graduation, I have used the skills I learned in the ESPP program—a deeper scientific understanding of the natural world, the ability to ask challenging questions about our relationship with it, and the analytical tools to approach policy issues from economic and ethical perspectives. As I continue my graduate studies, my experience in the program continues to inspire me to help solve what I believe are among the greatest challenges of our time.

BASIL WILLIAMS ’14
ESPP PRIMARY

The ESPP experience is unique because of its inherent interdisciplinary nature and has challenged me to analyze environmental issues from a range of perspectives (scientific, political, economic, legal, etc.). ESPP allows students to take advantage of the expansive resources of several departments and receive the individualized support of a smaller department. The breadth and depth of the concentration afforded me the opportunity to gain a broad understanding of the natural world while also gaining a deeper knowledge in my area of specialization.

However, the best part of the ESPP department is the people. Whether through the classroom, extracurriculars, or department field trips, I have formed invaluable relationships with other students that share my passion and interest in environmental concerns. I also benefitted from working very closely with a welcoming faculty through research and seminars. As I embark on a career in solar energy, I am confident that my ESPP experience prepared me well to think critically about complex environmental problems.

PATRICK DOWLING ’16
ESPP PRIMARY

I knew I wanted to do a secondary in ESPP almost before I had picked my concentration. Growing up in Oregon, I was raised with an appreciation for the natural world and had always been interested in the intersection between people and their environments. While my real strengths and passions were on the social side of things (which is why I ultimately concentrated in anthropology) I knew that the tangible skill set I would gain from studying environmental policy and science courses would add a level of both specialty and credibility to my undergraduate degree. The best part was that these courses were so flexible; I fulfilled some of my requirements with courses I took while studying abroad in Ecuador, as well as others more related to my thesis. In addition, the guidance and expertise of the professors in the department has been an invaluable asset in moving towards my academic and professional goals. For me, having a deeper understanding of the natural world (from ecology to climate change) has resulted in a deeper understanding of the human world, and I feel have truly benefitted from studying ESPP.

ANNELI TOSTAR ’15
ESPP SECONDARY

I chose to study ESPP because all governments, companies, and communities are thinking about environmental challenges on some level, and I want to be a part of growing efforts to address those challenges. I was also attracted to this concentration because it allowed me to fully experience a liberal arts education by exposing me to and integrating multiple fields of study. The ESPP program at Harvard has provided me with a valuable, interdisciplinary understanding of environmental challenges, while flexibly enabling me to focus on aspects that I am most interested in. I am incredibly grateful for the close attention that the faculty and staff pay to their students. Given the multilayered nature of our subject matter, it was crucial to be able to work with mentors and administrators who could help me develop a clear academic vision and concrete research goals.

REYLON YOUNT ’16
ESPP PRIMARY
ENVIRONMENTAL SCIENCE AND PUBLIC POLICY COURSE SEQUENCE

A true interdisciplinary concentration, we have course requirements in the physical, biological, and social sciences and mathematics. It is important for students to take the foundational courses in their first and second year so that they are prepared for more advanced courses later. Students are encouraged to take more advanced courses where appropriate. Please contact the undergraduate coordinator or Head Tutor with questions about placement and course selections.

The chart below lists courses ESPP recommends students consider taking within their first three terms at Harvard. Each student’s plan of study and trajectory is different so we encourage you to contact us directly for advice on course selection.

</tbody>
</table>
ENVIRONMENTAL SCIENCE AND PUBLIC POLICY SECONDARY REQUIREMENTS
(5 COURSES AND COLLOQUIUM PARTICIPATION)

Through the ESPP secondary field, students become well-versed in the broad, interconnected issues of environment and public policy through course work and a colloquium. Students choose courses in biology, chemistry, earth and environmental sciences, economics, government, engineering, and mathematics, complementing their primary studies with courses that will provide balanced exposure to environmental science and policy perspectives.

REQUIREMENTS
The ESPP secondary field requires the successful completion of 5 courses, including one foundational course and four upper-level courses. Students must also participate in a program colloquium, as outlined below.

STUDENTS CHOOSE ONE OF THE FOLLOWING FOUNDATIONAL COURSES:
- ESPP 11: Sustainable Development or
- EPS 50: The Fluid Earth: Oceans, Atmosphere, Climate and Environment or
- SPU 25: Energy and Climate: Vision for the Future or
- SPU 29: The Climate-Energy Challenge or
- SPU 31: Energy Resources and the Environment or
- SLS 25: Trees, Forests, and Global Change

STUDENTS MUST CHOOSE AT LEAST FOUR ADDITIONAL UPPER-LEVEL COURSES
At least two courses must be chosen from each of two elective categories: Social Sciences and Public Policy, and Natural Sciences and Engineering. The complete list of course options can be found on the ESPP website: http://espp.fas.harvard.edu/.

COLLOQUIUM
During each semester there are several opportunities for ESPP secondary field students to come together to explore various environmental topics through facilitated discussions. These discussions require preparatory readings and/or prior attendance at a public lecture on campus, and students are required to attend at least one session per semester once they have been accepted into the program.
ENERGY & ENVIRONMENT SECONDARY FIELD REQUIREMENTS
(4 COURSES AND COLLOQUIUM PARTICIPATION)

The energy-environment challenge is a defining issue of our time, and one of Harvard’s greatest contributions to meeting that challenge will be the education of a new generation of leaders in science, business, law, design, and public service. To this end, the Environmental Science and Public Policy (ESPP) program, in coordination with the Harvard University Center for the Environment (HUCE), is pleased to offer the secondary field in Energy and Environment (E&E). Through coursework and a colloquium, students engaged in the E&E secondary field will increase their exposure to, and literacy in, the interdisciplinary nature of issues related to energy and the environment.

In the context of the E&E secondary field, “Energy” refers to the production, distribution, and use of energy by individuals and society for a variety of purposes. This includes the various technologies, policies, and challenges associated with meeting increasing global energy demands. “Environment” refers to the understanding of the relationships and balances of the natural and constructed world at multiple scales, including how anthropogenic activities and policies affect the relationships between energy demand, environmental quality, and climate change. Students from a wide range of concentrations, including the humanities, are invited to participate in the program to explore how different disciplinary perspectives on energy and environment intersect and inform one another.

REQUIREMENTS
The E&E secondary field requires the successful completion of 4 courses, including one foundational course and three upper-level courses. Students must also participate in a program colloquium, as outlined below.

STUDENTS CHOOSE ONE OF THE FOLLOWING FOUNDATIONAL COURSES, ALL OF WHICH INCLUDE CONTENT RELATED TO BOTH ENERGY AND ENVIRONMENT:
- SPU 25: Energy and Climate: Vision for the Future or
- SPU 29: The Climate-Energy Challenge or
- SPU 31: Energy Resources and the Environment or
- ESPP 11: Sustainable Development or
- ES 6: Introduction to Environmental Science and Technology

STUDENTS CHOOSE THREE ADDITIONAL UPPER-LEVEL COURSES
At least one course must be chosen from each of two elective categories: Social Sciences and Humanities, and Natural Sciences and Engineering. The complete list of course options can be found on the ESPP website: http://espp.fas.harvard.edu/.

COLLOQUIUM
During each semester there are several opportunities for E&E secondary field students to come together to explore various energy and environmental topics through facilitated discussions. These discussions require preparatory readings and/or prior attendance at a public lecture on campus, and students are required to attend at least one session per semester once they have been accepted into the program.
ATTORNEY
AMY KOBELSKI TRUEBLOOD ‘00
I’ve really come to appreciate the depth and breadth of my Environmental Science and Public Policy education as a trial and appellate litigation attorney. The economics and public policy aspects were perhaps most foreign to me when I entered college, and I’ve found them to be particularly useful in reading and understanding legislation and—truly—the world around me every day. My concentration proved extremely valuable in defending a $100 million environmental legal malpractice action, but I also worked on antitrust matters that drew heavily on my economics background. ESPP gave me a phenomenal foundation on which to build specific knowledge as required by my career as a litigator. Moreover, my focus on environmental economics is something I think about nearly everyday when reading about world events.

CORPORATE BUSINESS PROFESSIONAL
ELIZABETH LEWIS ’01
HEAD OF SUSTAINABLE INVESTING, WORLD RESOURCES INSTITUTE
I credit ESPP with giving me a strong scientific understanding of the world’s biggest long-term challenges—and inspiring me to focus my career on solving these challenges. My education on climate change education stands out. I was in college long before the world was talking about climate change, and my professors were on the cutting edge.

ESPP also taught me—through courses in diverse disciplines, and relationships with professors, alumni and other students—that the world was rapidly changing. It would be important to be flexible and take advantage of unexpected opportunities. After Harvard, I’ve spent most of my career in management consulting and private equity with a focus on technology innovation, energy and natural resource management. I believe in the power of innovation and capitalism to improve the livelihoods of people around the world and solve our biggest challenges. In the best circumstances, harnessing these forces requires pioneering leadership and people with a range of skills and experiences.

SURGEON
DR. JOSEPH LYNCH ’98
ORTHOPAEDIC SURGEON, US NAVY
The ESPP program was extremely valuable in preparing me for my current career. ESPP provided breath in the sciences and allowed study of subjects which are unique, intriguing, and current. For those pursuing medicine, ESPP was an ideal concentration as it facilitates completion of the typical “pre-med” requirements, but more importantly it affords an opportunity to explore one’s talents in the sciences as applied to other fields. One of my fondest memories of Harvard was the concentration and the educational requirements of the degree—phenomenal!

POSTDOCTORAL SCHOLAR
JULIET LAMB ’05
SOUTH CAROLINA COOPERATIVE FISH AND WILDLIFE RESEARCH UNIT, CLEMSON UNIVERSITY
My undergraduate study was extremely useful. I have encountered many other graduate students and professionals in conservation biology who do not have any academic background in policy or law. In a field as integrative and interdisciplinary as fisheries and wildlife biology, I feel that I am at a huge advantage in having a solid understanding of the economic, legal, and governance aspects of conservation in addition to its scientific components. As an undergraduate, I shifted from a pre-veterinary focus dominated by broad chemistry, biology, and physics courses to a more organismic track. My happiest years in ESPP came at the end of my tenure, when I had begun to explore the small and focused classes in ESPP, OEB, EPS, etc. I wish I had identified earlier that my interests were in species and ecosystem conservation rather than veterinary medicine, because I would have been able to tailor my education more directly to my career. In my Master’s and PhD studies, I have never been as impressed with the classes I’ve taken as I was with some of my ESPP classes.

PROFESSOR
JACLYN HATALA MATTHES ’07
ASSISTANT PROFESSOR OF GEOGRAPHY, DARTMOUTH COLLEGE
My undergraduate education provided not only essential technical preparation for my present research, but was also the source of the intellectual motivation to pursue a career in environmental science in the first place. Before I “discovered” the ESPP concentration during my sophomore year, I felt a bit at a loss about how to negotiate my various interests in many scientific disciplines. The ESPP concentration allowed me to put together an interdisciplinary course of study with a rigorous foundation in ecology, chemistry, physics, and statistics. I also appreciated the breadth of study in ESPP through the requirements in economics and policy, and I have drawn on my experience in these courses while interacting with colleagues from different academic fields in my current work. I found the process of developing, researching, and writing a senior thesis and the mentorship that I received during this experience particularly enjoyable, and it inspired me to pursue a career in environmental research.
integrated and very relevant to the real world. Today, I teach in business school, and do research on how businesses and other organizations relate to a range of social problems. ESPP was actually great preparation for way I do now: it really got me thinking about how hard it is to apply scientific rigor to problems that have a heavy human component.

**PHD CANDIDATE**

**MOLLIE HOGAN ’01**

**DOCTORAL CANDIDATE IN HEALTH SERVICES**

**UNIVERSITY OF WASHINGTON**

I work in global health measurement, and was well prepared for this area of work by ESPP, particularly via the courses on human health and the environment and the quantitative courses (such as calculus, ecology, economics). My senior thesis prepared me well for a career in critical independent research. After three years working as a technical officer measuring child health inequalities at the World Health Organization in Geneva, I worked in Thailand for almost four years on a health system priority setting project at the Ministry of Health. I am now working on my doctorate at the University of Washington in Health Services, focusing on the measurement of maternal mortality worldwide.

**PROFESSOR**

**NOELLE ECKLEY SELIN ’99**

**ESTHER AND HAROLD E. EGDERTON CAREER DEVELOPMENT ASSOCIATE PROFESSOR, DEPARTMENT OF EARTH, ATMOSPHERIC AND PLANETARY SCIENCES AT MIT**

My ESPP experience gave me a thorough grounding in both the scientific and policy questions important to understanding the environment. After graduating, I spent a few years working on environmental policy issues in the US and Europe. When I decided to start a PhD program in atmospheric science, I had a solid scientific background in addition to a strong policy focus. I am now a faculty member in an interdisciplinary department, where my work builds on both my science and policy backgrounds. ESPP is a unique program, and my experiences as an ESPP concentrator at Harvard were a strong influence on where I am today. I even still refer back to my senior thesis!

**STRATEGIC POLICY ADVISOR**

**ISABELLA WECHSLER ’13**

**NEW YORK CITY DEPARTMENT OF ENVIRONMENTAL PROTECTION**

The ESPP program was a seminal part of my Harvard experience. I loved the ESPP junior tutorials and took many provoking, inspiring classes that challenged my definition of “sustainability” and taught me to conceptualize stakeholders and problems in entirely new ways. The ESPP concentration gave me a series of frameworks to think about change, and through an emphasis on case studies and success stories, taught me that the most overwhelming obstacles can be tackled despite their daunting scope. In a field that bumps up against climate change in innumerable contexts, ESPP focused on concrete, actionable solutions and encouraged its students to seek hands-on experiences outside of class. Some of my favorite memories include creating a land-use plan for Lake Placid in Florida during a week-long field trip and sailing in Key West while exploring oceanographic research during J-term. In addition, my ESPP advisers and professors have been the kindest and most generous mentors and teachers. The depth of their knowledge and experience has nudged my own intellectual standards to another plane altogether, and I look forward to staying in touch with them throughout my career. I worked as an Urban Fellow in NYC and now as a Strategic Policy Advisor, and continue to be intrigued by the fascinating ways in which behavioral economics and psychology apply to environmental policy. I will be forever grateful to ESPP for opening my eyes and heart to the complex environmental issues that will demand the very best of our capacity for empathy and intellectual creativity.

INTEGRATIVE BIOLOGY
George Evelyn Hutchinson described the history and dynamics of life as an evolutionary play in an ecological theater. The concentration in Integrative Biology (the concentration overseen by the Department of Organismic & Evolutionary Biology) is inherently interdisciplinary, encompassing mathematical and computational biology, functional and genetic approaches to morphology and development, as well as genetics, evolution, and ecology.

IB asks questions about the function, evolution, and interaction of organisms, both now, in the past, and in the future. What kinds of organisms are there and how are they related? How is an organism’s functional design and behavior related to both its physical environment and its interactions with other organisms? What are the genetic and developmental mechanisms underlying an organism’s morphology, or how is evolution influenced by development and vice versa? The concentration’s new name reflects both the OEB department’s broad research scope and scientific priority: to understand natural systems across levels of biological analysis. A detailed understanding of cellular processes, for example, can help us understand an organism’s ecology.

The beauty of biology is revealed through the evolution of its complexity and the interactions of organisms in their environment...
I loved OEB/IB for the flexibility it gave me to explore any and every aspect of biology—I could pick classes that genuinely interested me without feeling restrained by departmental requirements. OEB/IB classes themselves are phenomenal, and their faculty are incredibly invested in the students and courses they teach—this is evident both in the quality of their teaching and their willingness to mentor students. And, the OEB/IB community is incredible—you are surrounded by peers who love what they do, who are diverse in their interests and talents, and who and are collaborative and non-competitive. Being an OEB/IB concentrator was one of the best decisions I made at Harvard—the faculty, the peers, and the coursework made my academic experience at Harvard wonderful.

ABBA PARKER ’17

I am very glad that I chose IB as my concentration. I see it as the real liberal arts choice within biology because the flexibility of its requirements mean that you can both take time to explore different areas within biology and focus deeply on whatever interests you most. The program exposed me to a huge breadth of biological science and allowed me to figure out with confidence what parts I personally want to study in the future. The classes within the department teach you a ton while maintaining a fun environment. My IB classmates are great people and each of them has some specific interest or passion within biology; these varying interests make each class an opportunity to see whatever we are studying from different perspectives as everyone brings their own views, curiosity, and expertise.

PRERNA BHAT ’16

OEB/IB is an amazing department, there’s a huge variety of classes to take and all the professors are enthusiastic and accessible. Definitely take advantage of courses that have cool field trips or the summer school programs abroad. The best part about OEB/IB is its broad perspective; you learn why things in biology are the way they are, rather than simply learning about the applications (though you learn that as well).

JUSTINE CHOW ’10

I loved being an OEB/IB concentrator—from as early as Visitas and the beginning of freshmen year, I felt that I was already welcomed into the concentration and that the advisors and instructors were very accessible and happy to talk about ways to get involved and explore the subject. I have found everyone in OEB, from fellow concentrators to grad students to faculty, to be extremely friendly, kind, and willing to help—so as far as concentrations have a culture, I think OEB/IB has a fantastically open one. Among the many awesome qualities that OEB/IB possesses is the variety of students in the concentration—people interested in a wide spectrum of topics, from bird identification to genetic analysis to computational biology to conservation, among many others—and having the opportunity to take classes on this breadth of topics within OEB, as well as to learn from the various passions of your classmates, was a highlight of my experience. OEB/IB really lets you make what you want of your class schedule and of your academic studies as a whole, and with few fixed requirements students have the flexibility to study whatever most interests them within this field. There are also wonderful opportunities to study abroad and to get funding to travel and do research. Additionally, OEB/IB is one of the few concentrations that regularly has field trips for many of its classes—and even outside of class, there are organized social events and trips to OEB/IB-related activities and places in and around campus/Boston. Being an OEB/IBer definitely helped me further my academic passions that I had coming into college, and shape and focus them into my aspirations for the future.

PRERNA BHAT ’16
INTEGRATIVE BIOLOGY COURSE SEQUENCE

The study of IB can be approached in many ways, reflecting primary interest in specific groups (e.g., plants, animals, micro-organisms); in a particular level of organization (e.g., ecological systems, evolutionary genetics); in an approach (e.g., biomechanics, developmental biology); or even in a desire to sample broadly across many topics.

Recognizing the value of learning about organisms in their natural habitats, IB offers a number of courses with significant field components. For some, this involves short trips to local environments of interest; for others, spring break sees the course re-locate to the Tropics. For example, OEB 51 (Invertebrate Biology) goes to coral reefs in Panama, and OEB 167 (Herpetology) to Costa Rica.

The chart below lists courses IB recommends students consider taking within their first three terms at Harvard. Each student's plan of study and trajectory is different so we encourage you to contact us directly for advice on course selection.

INTEGRATIVE BIOLOGY SECONDARY REQUIREMENTS
(5 COURSES)

A Secondary Field in Integrative Biology (IB) is offered by the Department of Organismic and Evolutionary Biology (OEB). Members of faculty in OEB study biological systems at all levels from molecules to ecosystems, united by a shared foundation in evolutionary biology. Our department offers courses in a broad range of topics, including (in alphabetical order): anatomy, behavior, biomechanics, development, ecology, entomology, evolution, forestry, genetics, genomics, marine biology, microbiology, molecular evolution, mycology, oceanography, paleontology, physiology, plant sciences, systematics, and zoology. OEB is also happy to give secondary field credit for relevant courses taken during a Study Abroad semester.

Students may have an interest in pursuing a secondary field of study in a particular sub-discipline, or may prefer to sample broadly across the offerings of the department. Rather than draft a set of requirements for each possible field of study, the department chose a flexible set of requirements that should maximize students' freedom to craft their own programs in consultation with an academic adviser.

A secondary field requires the completion of five courses in OEB. For this purpose all courses listed in the OEB section of the Courses of Instruction, including cross-listed courses, as well as Life Sciences 1b and Life Sciences 2, will count as courses in OEB.

WHERE YOUR IB DEGREE CAN TAKE YOU

SCIENCE WRITER
NATALIE JACEWICZ ’13
Concentrating in OEB/IB was one of the best decisions I made in college. You will have down-to-earth and accessible professors, friendly peers, and Caribbean-based classes. You will also have access to amazing lab work and museum collections, making you the coolest kid eva. Since graduation, I’ve written about science for many publications including The Atlantic and Scientific American, and I’m currently at NPR’s science desk. My connections with the Harvard OEB department continue to help me hunt down stories and write analytically about the world we live in.

FIFTH-YEAR GRADUATE STUDENT
STANFORD BIOLOGY DEPARTMENT
HANNAH FRANK ’09
Concentrating in OEB/IB was one of my favorite parts of Harvard—my interactions with many wonderful professors, graduate students and other undergraduates in the field, the lab, the museum and the classroom is a large part of why I decided to go to graduate school and these people remain my mentors and colleagues today. In no other concentration would you watch birds feed while floating in the ocean off Mexico, spend an afternoon chasing down the reagents to remove shellac from a mastodon skull, write a term paper on the evolution of venom, or fall into quite so many mud puddles. You’ll also be the most interesting person at cocktail parties (whether it’s a reception during which the president of the College tells you that you “have to compare lizard catching tips with her [10 year old] son” or a concert during which a woman’s only reaction to your dissertation work collecting bodily fluid samples from bats is “but you’re so feminine!”).

HARVARD ENVIRONMENTAL SCIENCES
HARVARD UNIVERSITY CENTER FOR THE ENVIRONMENT

The Harvard University Center for the Environment (HUCE) encourages research and education about the environment and its many interactions with human society.

The Center draws its strength from faculty members and students across the University who make up a remarkable intellectual community of scholars, researchers, and teachers of diverse fields including chemistry, earth and planetary sciences, engineering and applied sciences, biology, public health and medicine, government, business, economics, religion, and law. The most pressing problems facing our natural environment are complex, often requiring collaborative investigation by scholars versed in different disciplines. By connecting scholars and practitioners from different disciplines, the Center for the Environment seeks to raise the quality of environmental research and teaching at Harvard and beyond.

Through a variety of grants and fellowships, the Center supports research related to the environment at every level, from undergraduates through senior faculty members. By sponsoring symposia, public lectures, and informal student convocations, the Center connects people with an interest in the environment.

SECONDARY FIELD IN ENERGY AND ENVIRONMENT

The Environmental Science and Public Policy Concentration, in coordination with HUCE, offers the Secondary Field in Energy and Environment (E&E) to increase Harvard students’ exposure to, and literacy in, the interconnecting set of issues related to energy and the environment while maintaining their focus in their home concentrations. Through debate and dialogue in coursework and seminars, students will identify the obstacles, highlight the opportunities, and define the discussion for an energy-environment strategy for the 21st century and beyond.

Students from a wide range of concentrations, including the humanities, are invited to participate in the program to explore how different disciplinary perspectives on energy and environment intersect and inform one another. To learn more or apply, visit: www.espp.fas.harvard.edu/energy-environment.

HUCE LECTURE SERIES AND SPECIAL EVENTS

HUCE hosts a number of lecture series, symposia, conferences, and special events each academic year. To watch videos from past talks, visit www.environment.harvard.edu/huce-videos. To learn more about energy and environmental events at Harvard and the greater Boston area, visit: www.environment.harvard.edu/events/calendar/list.

FUNDING SOURCES

Undergraduate students can apply for the Undergraduate Summer Research Fund, which provides financial support for student research projects related to energy and the environment.

The fund supports two types of research experiences for students: independent research projects and research assistantships based on faculty-directed research. Award amounts are usually between $500-$3,000.

To learn more about funding sources, visit: www.environment.harvard.edu/student-resources/undergraduate-summer-research-fund.
ENVIRONMENTAL COURSE GUIDE

HUCE annually updates the Environmental Course Guide, a list of Harvard courses most relevant to energy and environmental studies. The Course Guide is searchable by keyword, school, research area, and semester. Visit www.environment.harvard.edu/student-resources/course-guide/courses to access the guide.

FACULTY ASSOCIATE DIRECTORY

Nearly 250 Harvard faculty from a variety of disciplines are affiliated with HUCE. As leading scholars in their fields, they provide expert knowledge on a number of energy and environmentally-related topics.

Faculty Associates represent these schools across the University:
• Faculty of Arts and Sciences
• Graduate School of Design
• Harvard Business School
• Harvard Divinity School
• Harvard Graduate School of Education
• Harvard John A. Paulson School of Engineering and Applied Sciences
• Harvard Kennedy School
• Harvard Law School
• Harvard Medical School
• Harvard T.H. Chan School of Public Health

The database of Faculty Associates, available on our website, is searchable alphabetically, by research area, school, department, and keyword: www.environment.harvard.edu/about/directory/faculty/

GET CONNECTED

Website: Stay connected to the Center’s news and events at www.environment.harvard.edu
