Pierce 320 AV Instructions

1. Pull down the projection screen.

2. Connect your computer to the projection cable in the room, using the VGA connector or the MiniDisplayPort/Thunderbolt adapter attached to the cable.

** If your computer only has an HDMI or USB-C connector, see the end of this page for contact info to borrow an HDMI or USB-C to VGA adapter.

3. The projector is powered on and off using its hand remote control - it automatically searches for the correct input when powered on, so it’s good to have the computer on and connected before you power on the projector.

4. When the blue light on the projector is flashing, the projector is in the off/standby mode. When the light is steady blue, the projector is on. It takes a minute or two, after pressing the power button, before the light stops flashing and the image appears.

5. There is no audio system in the room. You may use the laptop speaker or borrow a powered audio speaker from SEAS AV if you want better sound.

If you have any problems, contact Rich McGirr at 617-496-5049 or the Helpdesk in MD Room 109

**Please remember to Exit the AV system to turn off the equipment**
